For the first time in 1916 an unusual source of poisoning was reported in which an outbreak of hydrogen arsenid poisoning occurred in British submarines Examination of the blood of three men sent to the Naval Hospital at Chatham gave no evidence of carbon monoxide poisoning The patients were jaundiced and showed a profound anemia In the first voyage the onset of the symptoms appeared generally on the third and fourth day On the second trip the symptoms were more pronounced and started on the first or second day The number and severity of the illness forced one boat to return at the end of four days Twenty men out of the twenty-six on board vomited within twenty minutes after the opening of the boat Proof of the illness was obtained by finding hydrogen arsenid in the air, by recovery of arsenic in the urine and hair of the victims The origin was finally traced to an alloy in the battery grids of the affected boats The amount of arsenic increased as the batteries got older The two symptoms most complained of were vomiting and dyspepsia, burning and griping abdominal pains were also noted In all there were 30 cases reported in which jaundice was a constant sign, headache, peripheral neuritis and cramps were frequently noted Arsenic was found in hair, urine, and nails

Confirming these findings two cases of submarine workers have come to our attention in which arsenic has been found as the causative factor These men suffered with a chronic arsenic poisoning in which skin manifestations were the external predominating symptoms These symptoms fall in our group of metallic eczemas previously described by us A short course of treatment with freshly prepared Sodium Thiosulphate has completely cleared these conditions These patients stated that many other members of the submarine crew suffered with similar symptoms showing that this is a common condition To illustrate the amount of gas that may be liberated, the following data is illuminating A submarine may have 150 batteries, each battery weighing approximately 2200 lbs, the men sleep over the batteries, thereby breathing the arsenic which is liberated as a gas

The presence of arsenic in glycerol, gelatin, glucose, bismuth subnitrate, canned fruits, tartar emetic, calamine lotion, Ichthyol, celery, lettuce, tomatoes, potatoes, cabbage, apples, pears, cherries, peaches, and wines, all offer opportunities for chronic arsenic action During a recent conversation with an eminent agriculturist, it was stated that arsenic was added to ensilage as a tonic effect for the fattening animals as well as for the milch cows The end result ofthis can only be the presence of arsenic in our meat and milk At this time the authors raise question in regard to the present methods of treating pernicious anemia by means of liver feeding In previous reports our investigations have shown the liver to be a great store house for arsenic May it not be possible that danger along these lines lies ahead?

The time has not yet arrived when obscure clinical symptoms are explained on the basis of the action of small amounts of metals This

sication may also be employed in the treatment of leucoplakia.

A combination of methods gives the best end-result in the treatment of carcinoma of the antrum. Unfortunately the condition is rarely observed early, the bony walls are often involved, requiring extensive surgery Electrocoagulation has been of great value in destroying the mass without hemorrhage or danger of metastasis After the growth has been removed and the cavity made accessible for radium application intense gamma radiation is given Two or three 50 millicurie radon tubes screened with one millimeter of brass may be applied to the region involved for twenty to twenty-four hours A combination of deep Roentgen ray and radon packs is applied externally over the cheek and to the regional lymphatics

Sarcoma of the nasal sinuses is more sensitive to radon treatment than carcinoma Surgical measures in the treatment of sarcoma of sinuses are best omitted or limited to the removal of a section to determine the type of tumor involved Deep Roentgen ray therapy plus radium packs will inhibit the growth and in some cases give clinical cures

Fibromas of the nasopharynx are dense, firm tumors composed of connective tissue and blood vessels They occur in early adult life and more often in males than in females They form a definite clinical picture, but the etiology is unknown The tumors are usually pedunculated and arise from the vault of the nasophraynx, although they may originate in the posterior ethmoid or sphenoid sinuses The surgical treatment of fibromas is attended with severe hemorrhages and frequent recurrences Radium treatment has been found to be a safe procedure and to give good results The technic now employed is to apply a 50 mg radium tube to the pedicle of growth for six hours in order to shrink the tumor and decrease the blood supply After two or three weeks, platinum radon seeds are inserted into the tumor mass with little or no danger of hemorrhage A radiation necrosis of the tumor mass is to be avoided, because of the danger of middle ear infection

Rhinoscleroma is a chronic inflammatory condition produced by Frisch's bacillus, which gradually causes obstruction of the upper air passages The action of radium in this condition is to produce dense fibrous tissue replacing the loose granulation fibrillar mesh work in the submucosa In early cases radium offers a good chance for a cure, and in the advanced cases palliative relief is obtained

The patient with a growth in the larynx should be carefully studied in order to arrive at the proper diagnosis On inspection it is oftentimes impossible to differentiate clinically between tuberculosis, syphilis, and carcinoma After the first two conditions have been ruled out, a biopsy should be done before radical treatment is undertaken

In the majority of cases the lesion is extrinsic involving the pyriform fossa, epiglottis and arytenoids An operation is not usually performed

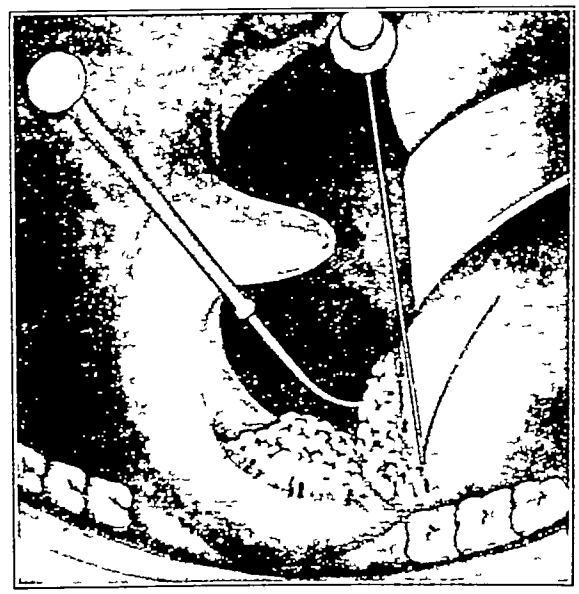

FIG. 4
Radon implants inserted into base of lesion

In intrinsic carcinoma of the larynx which is early or moderately advanced laryngectomy has given the greatest percentage of cures Encouraging results have been obtained recently in the extrinsic or inoperable cases by the insertion of filtered radon implants One millicurie is used to each centimeter of tumor tissue They are implanted through the bronchoscope Care is taken not to insert the implants into the cartilage Tracheotomy is performed in those cases in which obstruction is marked During the two weeks following the radon treatment there is usually a severe inflammatory reaction with symptoms exaggerated They may be controlled by the use of codeine During the third or fourth weeks after the treatment the lesions show marked regression, healing occurring, the patient is decidedly more comfortable The painful swallowing is relieved and a gain of weight is noticed In addition to the implantation method external radon packs are employed The treatment of extrinsic carcinoma of the larynx gives palliative results well worth while

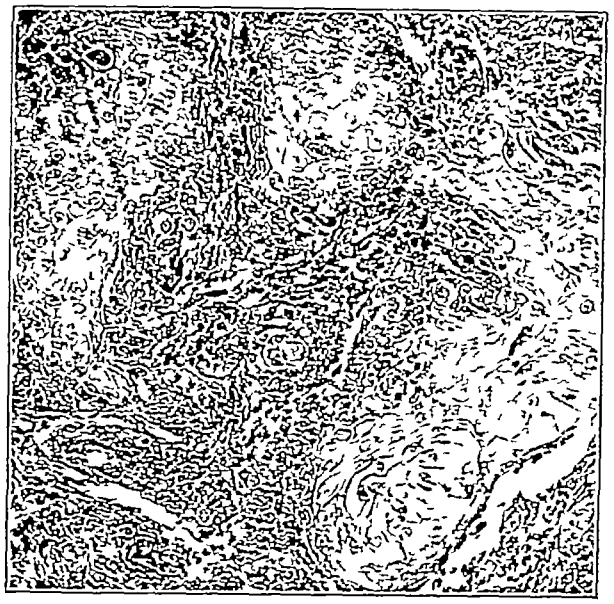

FIG 1
Squamous cell epidermoid carcinoma of tonsil

the extent of the induration A section for microscopical study should be taken in every case Deep x-ray therapy or radon packs are applied to the lymph nodes of the affected side whether palpable or not.

Irregularities of the teeth, ill fitting plates, syphilis and tobacco are etiological factors in the production of carcinoma of the tongue Nearly all the cases are of the squamous cell epidermoid type Carcinoma at the tip and side of the tongue are much more favorable for treatment than those at the base Interstitial radon implantations permit of an accurate and even distribution of radiation throughout the tumor mass which was not possible by surface application One to 1 5 millicurie gold implants placed one centimeter apart seems to be the proper dosage They should not be placed too near the bone because of the danger of necrosis Where possible it is better to introduce the trocar through healthy tissue at the base of growth rather than through the tumor tissue which is often ulcerated Ligation of the external carotid above the superior thryoid branch is advisable The lymph node involvement when movable may be removed surgically Combination of deep x-ray and radon packs are applied to the lymphatic areas on each side of the neck Electrocoagulation of large ulcerated areas may be advisable in some cases and radon implants used in the base of the wound

Excellent results are obtained by radium treatment of carcinoma of lip The two clinically different varieties, papillary and ulcerated, differ in their clinical course, the one does not invade the lymph nodes for many months, the other tends to metastasis early Radon may be applied by surface radiation from three sides However should the lesion be deeply infiltrating, platinum radium needles or gold radon implants 1 0 to 1 5 millicurie each should be inserted into the base of the growth The lymph nodes of the neck should be irradiated whether palpable or not The cosmetic results following radon treatment are usually superior to that of surgery and the end results better It seems justifiable to treat epithelioma of lip by radium rather than surgery because of the slight defect that remains, the ease of the radon applications, and permanency of results

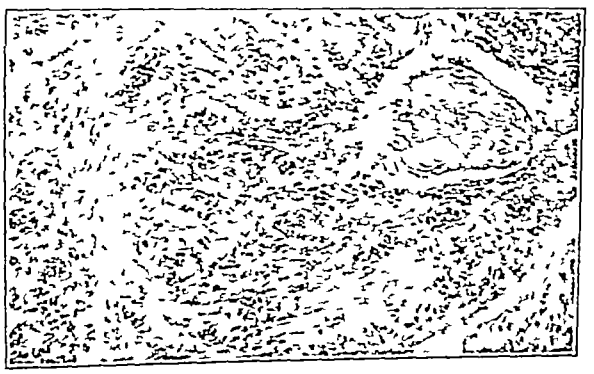

FIG 2
Eleven days after initial radium application

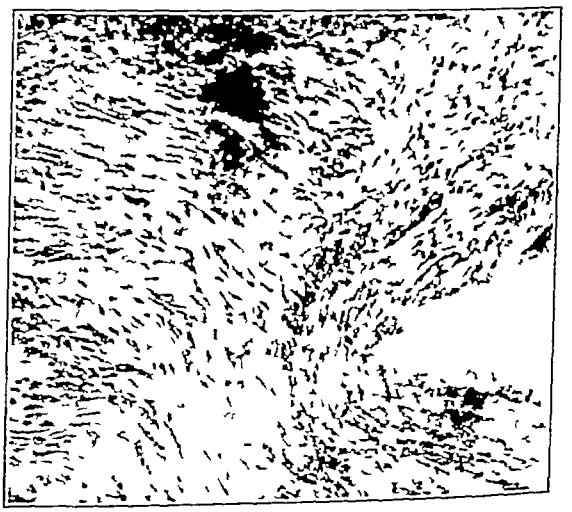

FIG 3
Connective tissue replaces malignant tissue

Leucoplakia of the oral cavity is nearly always due to chronic irritation from bad teeth, tobacco or syphilis Better oral hygiene in which the causative factors are removed will cause many of these lesions to disappear In the thicker lesions it is necessary to use caustic gamma ray doses of radon The application of 50 millicurie tubes screened with one millimeter brass are applied for two or three hours to each area Electropes-

MISSING TEETH

By WILLIAM LINTZ, M D, BROOKLYN, N Y

THE relationship of teeth to general health is well recognized and its importance universally conceded so that no further comment is necessary on the subject. If more doctors would be dentists and more dentists would be doctors a happy relationship would then exist, which would ultimately reflect unlimited benefit to the patient

This study was undertaken especially to see whether the teeth are lost alike in both jaws What percentage of the teeth are lost by the average patient when he presents himself at the doctor's office for examination, and in what order they are lost During the course of this study valuable information was revealed which is of great interest to the physician and dentist alike.

Three hundred and sixty-one consecutive office patients presented themselves with the various complaints for which they come to an internist, were examined carefully regarding missing teeth and the condition of the remaining teeth As a rule we found that the more teeth were lost, the remaining teeth were in poor shape The converse of this proposition was also true This is because patients like to retain as many teeth as possible, even if they are badly diseased. The teeth were lost spontaneously or extracted, in both instances on account of diseased conditions So that missing teeth can be taken as evidence of diseased teeth Only rarely, however, were healthy teeth extracted on account of mistaken diagnosis, or unsatisfactory therapeutic results This could have been avoided if the principle were followed that a tooth must be diseased as a prerequisite for extraction for any condition I believe that with modern scientific methods of investigation—*x*-ray, bacteriology, electrical reactions, etc., a definite diagnosis as to dental disease can be established in practically every instance When dealing with impacted teeth, of course other requirements must be met, for extraction *See Chart Next Page*

A There were 97 males in this group There is a definite increase in the loss of teeth between the ages of 35-40 years and another marked increase between 50-55 years The apparent increase which occurs between 20-25 years is unreliable since there are only 4 cases in this group 15 67% more teeth were lost in the upper than in the lower jaw The teeth are not lost haphazardly but in a definite order or sequence, which is practically the same in both jaws, namely molars, bicuspids, central incisors, lateral incisors and canines The molars are the most frequent teeth lost and the canines the least and last to go

B There were 252 females in this group There is a definite increase in the loss of teeth in the female between the ages of 30-35 years and 40-45 years 16 60% more teeth were lost in the upper than in the lower jaw The sequence for the loss of teeth in both jaws were the same as in the males—molars, bicuspids, central incisors, lateral incisors and canines Again we see the molar the most fragile tooth and the canine the most hardy one

C Considering the 349 cases composed of male and female together, we find that there is a definite increase in the loss of teeth at the ages of 30-35 years and 50-55 years The teeth are lost in the following sequence—molars, bicuspids, central incisors, lateral incisors, and canines, 16 40% more teeth are lost in the upper than in the lower jaw Although in the mouth there are only three times as many molars as canines, they are lost 5½ times as many as compared to the canine teeth

Non-Pregnant Women

(A) 69 Cases—Upper Jaw—161 teeth 14% Lower Jaw—152 teeth 13% Total 313 teeth 14%

Males

(B) 108 Cases—Upper Jaw—385 teeth 22% Lower Jaw—309 teeth 17% Total 694 teeth 20%

Women With a History of Pregnancy

(C) 184 Cases—Upper Jaw—1394 teeth 47% Lower Jaw—1224 teeth 41% Total 2618 teeth 44%

Total Females

253 Cases—Upper Jaw—1555 teeth 38% Lower Jaw—1376 teeth 33% Total 2931 teeth 36%

Grand Total all Cases

361 Cases—Upper Jaw—1940 teeth 33% Lower Jaw—1685 teeth 29% Total 3625 teeth 32%

From this table we see that the teeth of women, who have never been pregnant, are the best of all, and retained the longest. Only 14% of the teeth were lost. The males come next with a loss of 20% of their teeth The women who have been pregnant show the greatest ravages, with a dental loss of 44% If we consider the entire group of 361 cases, composed of men, pregnant and non-pregnant women and children, we find that they present themselves at the office with 32% of their teeth missing

Resume

1 Needless extraction of teeth can be avoided if modern diagnostic methods are employed.

2 The female loses her teeth five years earlier than the male

3 About 16% more teeth are lost in the upper than the lower jaw This is true both for male and female.

4 Both sexes lose their teeth in a definite sequence—viz, molars, bicuspids, lateral incisors, central incisors and canines

5 The molar is the most fragile tooth and the canine the hardiest.

6 361 patients lost 32% of their teeth.

origin or etiology of his attacks was the ultra-violet rays

Case Number 2 Doctor's wife, comes complaining of pain in the eyes and photophobia. The onset similar to the previous case started first with an itching of the eyes, extreme lacrimation, and finally photophobia and pain This condition lasted throughout the night and the patient appeared in my office the next morning also demonstrating the typical injection of the lid vessels, conjunctival engorgement, some haziness of the cornea, and a marked contraction of the pupil In this case the doctor himself suggested the etiology As a baby patient was brought to him for treatment with the Ultra-Violet rays he asked his wife to hold the baby while he administered the treatment, since the baby was restless and cranky She neglected to put on protective glasses From my previous experience it was easy for me to know the condition with which I was dealing and I was able to relieve her in a few minutes, her condition cleared up in about five days

Case Number 3 Male, 40, riveter, comes in complaining of severe pain in the eyes, photophobia, and blindness He gives a history that while he was riveting in the subway construction, a gang next to him was doing some welding While it did not affect him immediately, about three or four hours later he too started to experience itching of the eyes, extreme lacrimation, photophobia, extreme pain in the eyes, and inability to see During that night he was taken to the Roosevelt Hospital but apparently they did not succeed in relieving him of his pain He was sent to me the next morning, unable to open his eyes, and complaining of severe pain in the eyes and head Upon examination his symptoms were found to be similar to those of the previous cases There appeared marked engorgement of the lid vessels, some injection of the conjunctiva, the cornea very hazy and dry This was another case suffering from exposure to strong light. I was able to relieve this patient too of his pain, but it took him from ten days to two weeks to throw off the effects of his affection, the last to go was the itching of the eyes

Now the question is with what condition are we dealing here. What is the injury produced by these exposures? After searching the literature on hand at that time I was unable to locate a description and a name for this particular type of injury Upon questioning various colleagues they all seemed to be at a loss as to the exact condition of this injury So thinking about the various phases of this condition and its manifestation I decided to call it "Photo-ophthalmia." Subsequent perusal of the literature disclosed that Parsons[2] and Verhoef and Bell[3] used this term in describing this condition in their experiments

That pathologic effects can be produced upon the structure of the eye by exposure to artificial or natural sources of light is certain when this takes place under sufficiently powerful exposure to radiant energy, but the essential fact is the discovery of the quantitative relations between the amount of incident energy and the effects These relations have generally been left quite out of the reckoning in discussing the subject with the result that they have led to vague and often quite unwarranted conclusions, as irrelevant as if one should condemn steam-heating as dangerous, because one can burn his fingers upon the radiator

We know that all radiation of whatever wave length is convertible into heat when absorbed by material bodies and may produce chemical changes as well. These chemical changes show a tendency to increase with the frequency of the oscillations, so that chemical changes are rare in the Infra-red and increasingly frequent as one approaches the extreme Ultra-violet. It is *this tendency* that is shown in the pathologic changes which may be caused in living cells by the incidence of radiation

Therefore, since the Ultra-violet rays are so commonly used now, and unfortunately indiscriminately at times, and since we are confronted with pathologic effects of these rays on the eye as in the above-mentioned cases, we will confine ourselves here to the pathologic action of Ultra-violet rays on the eye

Verhoef and Bell[4] showed very definitely that we can measure the quantitative and qualitative amount of radiant energy of the Ultra-violet ray to produce pathologic changes in the eye. They proceeded to do this in experimentation on rabbits' eyes, exposing them to the quartz lamp The problem that they tried to solve was as to the quality of radiation as well as quantity that is necessary to produce these changes Furthermore, in order to produce these changes is it necessary to have the same quantity or dosage to be administered at one time or could the same quantity or dosage be given in fractional amounts and still produce these pathologic changes?

Using a mercury quartz lamp in their experiments on the rabbit they exposed its eyes to this lamp at a distance of five-tenths of a meter to various periods of time, one minute, two and one-half minutes, three and one-half minutes, etc The minimum exposure at that distance required to produce the first sign of pathologic changes on the surface of the cornea was determined to be about six minutes This figure may vary slightly with different types of animals They also observed that to produce loss of corneal epithelium, an exposure about two and one half times that necessary to produce slight Photo-ophthalmia was re-

PATHOLOGIC EFFECTS OF THE ULTRA-VIOLET RAYS ON THE EYE AND TREATMENT

By EDWARD G LEAR M D, NEW YORK, N Y

THAT strong rays of light are capable of producing injuries to the eye is a well-known fact. Snow blindness and eclipse blindness are two conditions in that category But under the present conditions snow blindness and eclipse blindness are rarely encountered by us, and we can disregard them for practical purposes

At the advent of electricity, however, we began to be confronted with new phases of light and some of their pathologic effects on the eye We know that the early workers in electricity experienced certain injuries when they were exposed to rays of light as in the case reported by Dr Charcot[1] Two chemists were experimenting over an arc light, supplied by a Bunsen battery, for a period of about one and a half hours, using this battery interruptedly so that all in all their exposure to the arc light did not last more than twenty minutes, during that period They were at a distance of about fifty centimeters from the arc While they were not sensible of a rising temperature, nevertheless, during that evening and the whole night which they passed without sleep they found in their eyes a feeling of severe irritation and saw continually flashes of colored spots The next day both had upon their faces erythema of a purplish color and experienced a feeling of pain and tension The appearance of the skin and parts affected was exactly that of a sunburn A slight desquamation was established at the end of four days, and lasted in all five or six days

But as electricity is being more and more used for illuminating purposes such as the powerful Klieg lights in the moving picture industry or the welding by electricity or the quartz lamp or the carbon arc lamp in therapy, new injuries to the eye manifest themselves when exposed to the light

In the literature on such subjects nothing specific had been done until recently to prove definitely the disease produced by the effects of these lights so far as diagnosis, symptomatology, pathology and therapy are concerned

Recently I had the occasion to treat several patients afflicted by exposure to certain light rays

Case Number 1 H S, male, 28, appeared in my office complaining of his eye blinking and tearing Upon examination there was a redness of the lid margin, engorgement of the lid vessels as well as the conjunctiva vessels The cornea seemed to be somewhat dry but otherwise negative I was at a loss to make a definite diagnosis at the time except for conjunctivitis However, this condition subsided within a few days

A week later the same patient appeared again with an intense pain in the eyes, more so in the right, engorgement of the lid vessels, the cornea dry and hazy, extreme photophobia, and marked contraction of the pupil The pain and photophobia were so severe that when I attempted to examine him with the light the patient fainted The history of the onset of this attack was that it began four hours before he appeared at my office, first with an itching of the eye, then tearing, and finally pain and inability to open the eye Upon installation of four percent cocaine solution in the eye the patient was temporarily relieved. In about six days it cleared up

Two weeks later the same patient, while spending the night in Brooklyn, experienced another attack in a more severe form, and passed the night in agony Early in the morning he called me, and appeared at my office complaining of severe pain in the eyes and head and extreme photophobia Upon examination I noticed an extreme injection of the lid vessel, edema, marked conjunctival injection, and the cornea dry and hazy The history of the onset of this attack was identical to the one previous This time I was totally convinced that whatever caused this condition the pain and photophobia were due to a marked ciliary spasm, and decided to use a cycleplegic, with the most astonishing results After about five minutes the pain and photophobia completely subsided, and cleared up in about a week

My interest in this case was greatly aroused, as the patient could not give any definite reason or cause for its onset. But after questioning him carefully I elicited the history that every attack that this man had, occurred on the day when he went to the Y M C A That led me to question him further as to his activities there He went to the "Y" for gymnastics and exercise and told me that after completing these he went into another room for sun ray treatments In describing the room he said that it contained several powerful Ultra-Violet ray machines going continuously In replying to my question as to whether or not he had protective glasses when in this room he answered that he did not, as the light seemed harmless to him The discrepancy in these attacks was that the first time he was exposed three minutes in that room, the second time five minutes, and the third time ten minutes This proved definitely to me the

remains to be determined by future observation and experiment

As regards the treatment, the ordinary treatment of conjunctivitis such as silver nitrate or zinc sulphate will aggravate the condition. The most gratifying effects are obtained from the immediate installation of a suitable cycloplegic preferably Homatropine, with cold applications, and the wearing of smoked glasses against strong rays of light.

COMBINED MORPHINE, SCOPOLAMINE AND RECTAL ETHER FOR ANALGESIA IN LABOR

By F J SCHOENECK, M D, SYRACUSE, N Y

IT IS the aim of every conscientious obstetrician to make the process of parturition as painless as possible, always, of course, within the limits of safety for mother and child He would fail in his duty as a physician if he did not keep this end in view This is not a purely modern endeavor Opium has long been used by the Egyptians and we read of coal-vapor being administered to the women of India during labor Simpson, however, first obtained satisfactory results in 1847 with ether and later used chloroform. As parturition is slow, a general anaesthetic for all stages is impossible and of value only at the end of the second stage when instrumental delivery is necessary or desirable Nitrous oxide has given us a formidable means of caring for the expulsive stage and it is the long first stage which we must now strive to relieve

Dammerschlaf, or "Twilight Sleep," of Kreug and Gauss was the greatest step in the direction of painless child-birth and some years ago was heralded as the perfect analgesia for labor Knipe well defined this as "that condition of the mind, in which, while the patient remains perfectly conscious and intelligent she, at the same time, loses knowledge of present events when they are completed" Unfortunately this ideal state of mind is not always produced, the patient, far from remaining intelligent, becomes excited and unruly and is hard to manage in many instances Special sound-proof rooms are necessary, abundant nursing help and almost constant attendance on the part of the obstetrician The next outstanding development was Gwathmey's "Synergistic Analgesia," consisting of Morphine and Magnesium Sulphate injections into the buttocks combined with rectal ether Very good results are obtained with this method, but occasional abscesses at the site of the magnesium Sulphate injections are encountered and there is some dispute as to the synergistic qualities of that salt when combined with morphine Other recent developments are sacral and spinal anaesthesia, using various preparations of novocaine, but they offer some dangers and are still in the experimental stage

We have seen good results from both Scopolamine-Morphine and "Synergistic Analgesia" in the hands of experienced men The method I wish to bring to your attention is essentially a combination of these two methods, and to my mind has distinct advantages over both in many instances

The ensuing report is based on two distinct series of cases The first from the private services of Dr Henry W Schoeneck and Dr E C Hughes at the Syracuse Memorial Hospital and the second from the ward service of Dr Victor L Zimmerman at the Brooklyn Hospital, Brooklyn, N Y

The method of administration is to give the active labor patient a hypodermic of morphine and scopolamine, followed in a short interval by a rectal injection of ether, alcohol and quinine in olive oil (Gwathmey's formula) The rectal and occasionally the hypodermic medication is repeated at various intervals as indicated in the individual cases

The successful administration of the combination produces a state of practically unconsciousness in the patient, while the uterine contractions and dilatation of the cervix continue—she is not conscious of having pains—in fact, she is sleeping Some patients, while not actually sleeping, get great relief from the labor pains

Illustration

Mrs C H, age 25, white, para I, L O.A

Labor First stage—11½ hours Second stage—1 hour 7 minutes Third stage—3 minutes

First Medication 7 hours after onset of labor At this time pains every 3-5 minutes Rectal exam Vertex low in mid-pelvis Cervix thin, dilated 2 fingers Given Morph Sulphate gr 1/6, Scopolamine gr 1/200 (H)

Fifteen minutes later Given rectal injection Quinine Hydro-bromide gr XX, Alcohol dr III, Ether oz IIss, Olive Oil—q s ad oz IV

Four hours later Rectal injection repeated

Two hours later Delivered Prophylactic forceps Median perineotomy

Result Patient went to sleep shortly after first rectal injection and remained so throughout entire labor, except for a period of about fifteen minutes just prior to second rectal injection, when she roused slightly Amnesia was complete

quired They further showed that if they exposed say, the right eye of a rabbit for about three and three quarter minutes and then after a ten-minute interval again to three and three quarter minutes, and the left eye to seven and one half minutes continuously the result was a reaction in both eyes, more marked in the right

Continuing with the fractional dosage experiments they showed conclusively that one can produce the reaction not only by continuous exposure over a definite period but one can get similar results by fractional exposure, the sum total of which is equal to continuous exposure provided these fractional exposures take place within the twenty-four hour period, as after twenty-four hours the tissue cells recuperate and one gets no effect with a fractional dosage

As regards the character of the reaction of the ocular tissues to abiotic radiation they showed in their experiments that after exposure of a rabbit's eyes to light containing abiotic rays no immediate changes take place, however great the intensity produced A heat effect was not produced and symptoms of irritation did not appear for several hours In other words there is a latent period before any visible effects are produced

This exists not only as regards clinical symptoms but also as regards histological changes In a general way it varies inversely with the severity of the exposure, but in no case is the first appearance of symptoms delayed longer than twenty-four hours The shortest latent period observed by them was thirty minutes The least effect that occurs after exposure to abiotic radiation consists in slight hyperemia of the conjunctiva After more intense exposure the congestion is comparatively greater and is associated with edema and purulent exudation There also may be conjunctival ecchymoses The cornea, after exposure sufficient to produce slight conjunctivitis, remains clear and shows only slight stippling of the surface After longer exposure the cornea becomes hazy in a rather sharply defined area

This delimitation is no doubt due chiefly to the fact that the rays strike the periphery of the cornea obliquely so that there is less light here per unit area and to a less extent to the greater loss by reflection at the periphery Over the central area the epithelium shows marked stippling and is then cast off, usually however, not until about twenty-four hours The loss of epithelium sometimes cannot be determined without the use of fluourescine staining, owing to the margins of the defect not then being sharply defined This is due to the fact, as shown by microscopic examination, that the epithelium usually becomes thinned by desquamation before solution of continuity occurs. The haziness of the cornea usually reaches its maximum in about forty-eight hours, when, as will be pointed out, there is some leucocytic infiltration

After three days the purulent conjunctival discharge becomes less but it may not entirely subside for about nine days The corneal epithelium is usually reformed on about the fourth day Haziness of the cornea noticeably begins to subside in three to ten days After five weeks only a slight central haze remains Following sufficiently intense exposure, new vessels are seen extending into the cornea from the limbus in about six days

The effect of the Ultra-violet rays on the iris after a liminal exposure is that of congestion of the vessels, contraction of the pupil and sometimes hemorrhagic spots in the iris While there is apparently no change in the lens yet thorough histological studies show that there is a slight haziness of the center of the lens capsule exposed to the direct Ultra-violet rays The lens substance, if affected any at all, is so only for a very microscopic distance from the capsule

About the reaction of the retina to these rays nothing definite is determined Fundus examination shows no gross changes with the exception of Case Number 1 where there was a clumping of pigment below the disc in the right eye Whether this was present before the exposure to the Ultra-violet rays or took place as a result of it I cannot say definitely According to Birch-Hirschfeld[5], Angelucci[6] and Engleman[7] the retina when exposed to light undergoes photo-chemical changes However Verhoef and Bell in their work do not believe that the retina is affected by the Ultra-violet rays since they believe these rays are absorbed by the cornea, aqueous, and lens That, however, is still to be determined

To summarize We see that the Ultra-violet rays are capable of producing a definite pathologic condition of the eye called "Photo-ophthalmia" From clinical and experimental observations we see that there is a definite period of latency between the time of exposure and the onset of symptoms

Secondly That a certain definite amount of these rays are capable of producing the pathologic condition in a one or liminal dose or in fractional or subliminal doses, the sum total of which should equal one continuous or liminal dose.

Thirdly That the onset of the symptoms are first itching, then pain and photophobia

Fourthly It is proven definitely, clinically as well as experimentally that the parts of the eye involved are the conjunctiva, cornea, iris and lens Whether the retina too is affected by these rays is not definitely established, and

(hepatic) function with complete recovery in twenty-four hours" Likewise, Cushney says that "When asphyxia is avoided, albuminuria is hardly met with under ether anaesthesia." Thus with ordinary care, we need not fear liver or kidney damage

A consideration of no small importance in any medication given during labor, is the effect on the foetus We have Cushney's statement that chloroform and ether pass from the maternal to the foetal circulation and occasionally ether may be detected on the breath of the new-born babe when this method has been used However, foetal asphyxia approaching the typical "scopolamanized" baby is not encountered Ether, per rectum, has been given as late as one half hour before delivery with no harm to the foetus, and we have at no time been concerned with serious asphyxia due to this method

We have in this combination, something to offer the multiparae in the way of amnesia, and what is far more important—analgesia. Attempts at "Twilight Sleep" see the labor completed too often before the patient has a chance to become scopolamanized As a rule, except for an occasional dose of morphine and gas administration for the second stage, multiparae are given little relief from their labors The large percentage of satisfactory results obtained for parous women in this series opens a fertile field for relief in ordinary multiparous labors

Another possibility is met in that group of patients, for whom, due to some reason, an oral anaesthetic is contraindicated These women may be delivered without the supplementation of oral anaesthesia. Four of the Brooklyn series were delivered in this manner They were all primiparae, three had prophylactic forceps and the fourth a manual control Two had perineotomies with consequent repair Two of these were Group I cases, i e complete amnesia and the other two Group II cases with satisfactory analgesia Thus the method offers a means of caring for those patients for whom we prefer no oral anaesthetic.

Conclusions

(1) Combined morphine, scopolamine and rectal ether gives good results in many labor cases
(2) Satisfactory results are obtained in 85-95% of the cases
(3) The contraindications are only of minor import.
(4) The time of labor is not prolonged
(5) There is no permanent maternal damage and likewise no alarming asphyxia of the child
(6) The method is especially beneficial to multiparae
(7) The method may supplant contraindicated oral anaesthetics

Group I (Complete Amnesia)	46%
Group II (Satisfactory Analgesia)	49%
Group III (Questionable)	3%
Group IV (Failure)	2%

There is no dogmatic routine—each case is an entity Best results, however, seem to be obtained if medication is started when the cervix is two-two and one-half fingers dilated with the patient in good active labor The preliminary hypodermic consists of 1/6–1/4 of morphine and 1/150–1/250 of scopolamine—according to the constitutional makeup of the patient Repeated scopolamine injections are of 1/300–1/400 grs The rectal ether may be repeated in whole or half amounts The average number of dosages per patient in the Syracuse series was Morphine 1 1, scopolamine 1 0, rectal ether 1 1 In the Brooklyn series Morphine 1 4, scopolamine 1 7, and rectal ether 1 8 The best interval between repeated dosages appears to be approximately two hours and no medication should be given in the two hours prior to delivery

SERIES I

Dr H W Schoeneck—Syracuse Memorial Hospital There were 145 cases in this group—48% primiparae and 52% multiparae 32% were occiput anterior presentations, 62% occiput posterior and the remaining 6% breech There were two pairs of twins

The average time of labor for primiparae was First stage, 14¾ hours Second stage 1 hour 50 minutes Multiparae First stage 6½ hours Second stage 50 minutes

The results were graded on a basis of (1) Excellent, (2) Good, (3) Fair, and (4) Poor

Supplementing the medication with gas-oxygen for the second stage 35% fell in the first group, i e, Excellent, 47% in the second group, i e, Good, 14% in the third group, i e, Fair and 4% in the fourth group, i e, Poor

SERIES II

Dr V L Zimmerman—The Brooklyn Hospital There were one hundred cases in this group—86% primiparae and 14% multiparae. 70% were occiput anterior presentations, 27% occiput posterior and the remaining 3% breech There was one pair of twins

The average time of labor for primiparae was First stage 11¾ hours Second stage 1 hour 20 minutes, Multiparae, First stage 8½ hours Second stage 40 minutes

The results were divided as follows Group I —Complete Amnesia, Group II—Satisfactory analgesia without complete amnesia, Group III —Questionable, and Group IV—Failure

Supplementing the medication with ether orally for the actual delivery, we obtained 46% in Group I, i e, Complete Amnesia 49% in Group II, i e, satisfactory Analgesia without complete amnesia, 3% in Group III, i e., Questionable and 2% in Group IV, i e, Failure

Thus on a basis of two hundred and forty-five cases, we should expect between 85-95% satisfactory results with this combined method

Naturally, there are certain disadvantages to this method but in general, they are minor An occasional patient is found susceptible to ether, or morphine and more or less violent vomiting is produced Such was the case with one patient and it was necessary to discontinue the medication In certain instances where the head rests directly on the perineum, it is mechanically impossible to inject the ether into the rectum The rectal ether is sometimes immediately expelled if the installation has not been slow The patient should be directed to approximate the thighs at the completion of the injection Again, the aseptic technique of delivery may be interfered with by the ejection of the remaining ether and oil as the patient bears down in the second stage. This may be prevented, however, by a gentle downward pressure exerted on the posterior vaginal wall before the patient is draped Finally there is the possibility of producing a colitis by the repeated introduction of ether into the rectum. There can be no question that a certain amount of irritation is produced With this fact in mind, we had proctoscopic observations made on four of the Brooklyn cases within twenty-four hours after delivery Three of these patients had one rectal injection and the fourth had three. The reports were as follows —

Case 1 Moderate proctitis and cryptitis
Case 2 Very mild colitis
Case 3 Slight proctitis
Case 4 Slight proctitis—apparently healing

None of these patients had any symptoms The rarity of any bowel disorder is astounding An occasional patient will mention a slight burning Prophylaxis against any disturbance consists in placing one half ounce of olive oil in the rectum before and after the ether-oil instillation and a gentle saline irrigation of the bowel six hours after delivery As far as we have observed, there is no major contraindication.

Long labors may necessitate repeated dosages of both the hypodermic medication and the ether injections We have given as many as five rectal installations, aggregating a total of 12½ ounces of ether and one hundred grains of quinine. We do not think this is a good policy and doubt if more than thre rectal injections should be given The quinine may easily be dispensed with when labor is in definite progress There has been absolutely no clinical evidences of harm from these large doses From the experimental viewpoint, likewise, is evidence against any permanent damage Rosenthal and Burns in their article entitled "The Effect of Anaesthetics on Hepatic Function" based on dog experimentation say that "no definite pathologic changes are produced in the liver by prolonged ether anaesthesia There is a definite transitory impairment, but recovery is usually complete in twenty-four hours Large doses of morphine in dogs causes depression of

PUBLIC RELATIONS COMMITTEE

It is the function of the Public Relations Committee of The Medical Society of the State of New York to deliberate with other agencies, official and unofficial, concerning plans, purposes, and objective in so far as they concern the medical profession and the health of the people of the state. Naturally, the public should look to the medical profession for guidance in all matters relating to health The practice of medicine is changing, therefore our profession must not limit its activities alone to curative medicine, it should take an advanced stand in the great problems of public health and disease prevention

Many agencies are earnestly working in these fields endeavoring to prevent the wastage of human life These agencies should be advised and guided by the medical profession of the particular county or community wherein such activity is being carried on Therefore every County Medical Society should keenly appreciate the necessity of appointing a committee to be known as its Public Relations Committee, such committee to be composed of strong, forceful leaders of the profession in their respective counties, men who are interested in humans and the civic things of life Such men will weld together in one cohesive, cooperating group the various organizations working for the betterment of health conditions

Forty-two of our county medical societies have such committees formed and operating I would urgently request the remaining eighteen county medical societies to do likewise. Organized medicine *must have* a Public Relations Committee in each County Medical Society

JAMES E SADLIER, M D
Chairman, Public Relations Committee,
Medical Society, State of New York

IS THIS JOURNAL READ?

Evidence that the New York State Journal of Medicine is read, even by city physicians and during the vacation season, is offered by the response to the twelve-line news note entitled "The New Directory" that was inserted in the Journals of August 15, September 1, and September 15

Many physicians, especially those in New York City, who had changed their locations clipped the notice from the Journal and sent it with the statement of their changed addresses Others wrote that they had read the notice in the Journal and hoped that there was still time for the insertion of their new addresses and telephone numbers

The response of physicians to appeals for information to be inserted in the Directory is far greater than ever before, and is an encouragement to the members of the publication committee and the editors to feature and emphasize those departments which characterize the Journal as the organ of the Medical Society of the State of New York and its constituent County Societies

---

ULTRA-VIOLET LIGHT AND RAYS

The health-giving effects of ultra-violet irradiations have been widely advertised in lay periodicals, as well as in medical journals The application of the rays appears to be simple If it is winter, all that one has to do is to buy a lamp and bask in its rays for half an hour every day, and if it is summer, put on a bathing suit and acquire a coat of tan But if the days are dark and the electric lamp is unavailable, then one can take the ultra-violet rays vicariously, either in the form of substances which have been subjected to irradiation, or in the natural form of cod liver oil

The physician thinks of irradiations as essential to growth and the utilization of calcium, and as a therapeutic measure in tuberculosis of the bones and joints

The people think of irradiation as something which will give them vigor, similar to that which the baby acquires on recovery from rickets They are therefore willing to buy irradiation in the three forms in which it is offered

1 Natural sunlight
2 Cod Liver Oil and irradiated substances
3 Artificial lamps

Sunlight is the great unfailing source of ultra-violet rays which are often excluded from growing children owing to the artificial customs of modern civilization The simplest and cheapest method of supplying the life-giving rays is by means of window glass which will transmit the rays

The transmission of ultra-violet rays by various kinds of window glass was discussed in this JOURNAL of February 1, 1928, page 168 The *Journal of the American Medical Association* of June 22, 1929, page 2088, contains a brief, clear

A DEPARTMENT OF MEDICAL SOCIETY PRACTICE

It does not seem right that the reports of the activities of the Medical Society of the State of New York and its Counties should be classed merely as news and printed in the department of "News Notes" These reports are records of the practice of medicine by Medical Societies in distinction from its practice by individual doctors as recorded in the scientific department This Journal should have a department with the box heading "Medical Society Practice" Such a department will be established as soon as reports are supplied with a volume and regularity sufficient to ensure its dignity and permanence

MEDICAL PROGRESS

Some Aspects of the Treatment of Rheumatoid Arthritis.—A. H. Douthwaite, writing in the *British Medical Journal*, June 8, 1929, i, 3570, states that so long as focal sepsis is considered the chief or only etiological factor in rheumatoid arthritis, and the metabolic changes that have been demonstrated are disregarded, treatment cannot be effective The utmost caution should be exercised before advising the removal of teeth or tonsils, as frequently suspicious conditions in these structures subside with recovery from the general disease On the other hand frank sepsis should be eliminated, as its presence lowers bodily resistance In the acute stage of rheumatoid arthritis the diet should be bulky and poor in nutritive value, consisting largely of fresh fruit and green vegetables After two weeks fish, chicken, and red meat may be added, but starchy and saccharine foods should be taken sparingly Medicinal treatment is of small value Apart from symptomatic treatment for the relief of pain, iodine and thyroid gland are chiefly favored. Douthwaite draws attention particularly to the benefit ensuing from consideration of the mechanical aspects of the disease. In the application of external heat he has achieved the best results by the use of a cabinet lighted by electric light bulbs and into which air, previously dried by passage through chemicals and impregnated with a volatile rubifacient, is pumped. The patient is given 1/10 of a grain of pilocarpine before entering the cabinet. The dryness of the air prevents the exhaustion produced by many other forms of heat General massage is carried out after each treatment. The application of hot paraffin wax bids fair to supersede many of the older forms of thermal treatment The wax can be applied at temperatures of 120° to 170° to practically the entire body In this way a constant high temperature can be maintained for half an hour or more Mechanical appliances for the control of joint movements are required in the acute stage of the diseases to prevent contractures and to prevent pain, and in the late stages when the patient suffers from the crippling effects of adhesions After the limbs have been immobilized for a week, the supports are removed daily, and gentle massage and cautious passive movements are instituted After acute symptoms have subsided, dry-air baths, massage, and active movements are prescribed. In the late stages of the disease mobility must be restored by graduated manipulation Various appliances have been devised which support the patient's weight and enable him to walk with little or no pain Increased range of movement is attained by active movements, in certain joints this may be aided by the inertia of a weight tied to the distal end of the limb

Prevention of Acute Cardiac Death.—Professor P Morawitz and Dr M Hochrein speak of the mental impression which remains after the medical man has seen his first acute cardiac death. The experience is something never to be forgotten and one constantly asks himself "cannot we sometimes prevent this death?" A few exceptional cases answer this in the affirmative and camphor, adrenalin, and strophanthin thrown directly into the heart have saved lives The mechanism of these deaths is not sufficiently clear and various explantations have been given. If fibrillation is the morbid underlying condition there must be a certain readiness to fibrillate, often conditioned probably by occlusion of a coronary twig Then we have to invoke certain eliciting agents Many of these deaths occur in the arteriosclerotic and luetic patient, and in a large group of patients the coronary vessels are at fault. But these "second" deaths—so-called because of their suddenness and rapidity—occur when the coronary system is quite intact, as a result of a general circulatory failure. In each group of patients there is the readiness to fibrillate or actual fibrillation In 1927 there were 43 cases of sudden cardiac death in the clinic from a variety of causes and over half of them were accounted for by coronary sclerosis, luetic aortitis, and myocardial degeneration. In 24 there were no evidences of circulatory insufficiency—in other words there was good compensation Nearly all of this group were due to coronary sclerosis, luetic aortitis, and general arteriosclerosis It is only since January, 1928, that the authors have placed some several hundred of their cardiac patients under the prophylactic use of quinidine and during that year but 19 cases of "second" heart death occurred They state that 3 grains of the alkaloid may be given daily for months at a time without ill effects.—*Munchener medizinische Wochenschrift*, June 28, 1929

The Paradoxical Activities of Strychnine.—R Hift of the Kaufman Heart Station, Vienna, says that the chief activity of strychnine

article on the clinical value of sunlight passing through ultra-violet transmitting glass The article is by Drs G H Caldwell and R H Dennett, and records their experience in a solarium with windows of ultra-violet glass built on the roof of the Post Graduate Hospital, New York City These authors subjected infants and children to the rays in the solarium, and expressed the conclusions that "enough of thee rays penetrated the glass to prevent rickets and spasmophilia in a normal, properly fed infant."

While sunlight is potent in the prevention of rickets and other deficiency conditions, cod liver oil, irradiated substances, and ultra-violet lamps are also necessary for cure All of these measures will be used by the physician, but only sunlight will be applied by the wise parent on his own prescription

THE HEART EXHIBIT

Special attention is called to the description of the Heart Exhibit which was held in connection with the Annual Meeting last year in Albany If an exhibit is to be popular it must be spectacular The heart exhibit was in no sense spectacular, but it was designed for serious study Its features are therefore preserved in the scientific department of this Journal

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Professional Problems—The problems before the medical profession change with the times Old problems become settled by a change of attitude on the part of the people quite as much as by the activities of the doctors themselves The people have passed laws against fraudulent medical advertisements, and have become wise in their knowledge of hygiene

The medical profession, too, has raised its own standards of the qualifications and the conduct of its members This JOURNAL for October, 1904, discussing two great problems before the medical profession said

"The secret remedy evil is degrading the medical faculty at this hour very much as the low-grade medical school debauched the profession two or three decades ago The cause is the same —laziness and love of money The cure is the same—an aroused professional sentiment. It was the leaven of honesty in the hearts of the doctors at large which compelled avaricious professors and low-grade medical schools to cease deluging the public with unsafe and ignorant medical practitioners It took energy, courage and unselfishness to carry on the work Honest men were compelled to antagonize friends, to fight against their alma maters, to relinquish opportunity of professional position, and to be misunderstood by other honest men. What matter! uphold the honor of the medical guild.

"You and I have now a similar, but mightier, task Then we fought colleges with self-satisfied faculties and thousands of dollars invested in teaching plants Now, we have to battle against professional dishonesty, therapeutic credulity, and millions of dollars invested in the manufacture of secret nostrums by quick-witted business men. The task is made more difficult by the fact that a very large number of these vaunted remedies and foods owe their popularity to the alcohol they contain It is not difficult to understand the ease with which makers of these remedies obtained certificates of their remedial value from preachers, statesmen, and women One would expect medical men to be too wary to be caught in the trap Their indorsement by physicians always suggests to me ludicrous credulity, therapeutic ignorance, or downright bribery

"The remedy for the evil lies in the development of a feeling of individual responsibility in the medical faculty Let every doctor refuse to accept samples of secret medicines, refuse to waste time talking therapeutics with smooth-tongued salesmen, refuse to debauch medical science by believing the mendacious advertisements called by the trade 'Literature,' and treat his patients honestly by giving them what they pay for, the best result of his own knowledge and experience"

latter of which are reproduced By the side of the well known facts of sinusal arrhythmia, which are characterized by alternation of phases with normal rhythm and phases of slowing, the PR of the auricle and ventricle showing no change, we find other arrhythmias closely related to the preceding and differing only through the fact that with the slowing of the rhythm is regularly associated a diminution of the interval PR which from positive becomes null On the same tracing one may find with only a few seconds interval the characteristics of one or the other of these arrhythmias This behavior throws some doubt on the genuineness of the nodal rhythm, but is readily explained if one will admit that the wave of muscular contraction from sinus to ventricle may follow two paths, one direct, the sinoventricular, the other indirect and of auricular derivation. The atrionector, or sinoauricular node, does not function well and the wave of auricular derivation is retarded, the chronological relations between P and R being modified with shortening, annulment, or inversion of P and R The particular grouping of P and R, or "nodal facies" is habitually interpreted as indicating a new rhythm—nodal, atrioventricular, or septal—which is substituted for the sinus rhythm The sole cause is auricular hysterosystole. The remarkable parallelism between slowing of the rhythm and slowing in the progress of the derived auricular wave is explained by the proximity of the sinus which controls the rhythm and the atrionector which controls the progress of the auricular wave The patient was a young pregnant woman in good condition who went through gestation without any trouble—*Arch des maladies du cœur,* August, 1929

Disappearance of the Signs of Mitral Lesion.—A Störmer refers to the teaching of the older clinicians that recovery from valvular lesions is unknown, although a number of moderns have placed on record the fact that the signs of involvement of the mitral and aortic valves may disappear Leyden spoke of "cure" of stenoses only, although murmurs have repeatedly disappeared in insufficiencies, and autopsies on cases with clinical valvular lesions have shown that apparently insufficient valves were intact. The author's case is that of a woman of 27 years who presented herself with symptoms of broken compensation of severe degree. The mitral was the seat of diastolic, systolic, and presystolic murmurs The treatment consisted of intravenous injections of strophantin, and after two months the compensation was quite restored and the patient was discharged Physical examination at this time showed a heart of normal area with an absence of murmurs and of all stasis phenomena, such as chronic bronchitis, stasis liver, anasarca, etc It was assumed that originally there had been an endocarditis secondary to an angina, with combined mitral insufficiency and stenosis and secondary hypertrophy. To visualize such recoveries we must imagine that the deposits which cause the valvular mischief are absorbed cleanly, without leaving any deformity In regard to the total recorded material there are two groups of cases In the first, after clinical valvular lesions all symptoms have disappeared, while in the second, no lesions have been found at autopsy despite a history of clinical organic disease In comparatively recent years authors have reported five cases in the first group and seven cases in the second group Some of the patients had not attained their full growth although others were well past this period—*Munchener medizinische Wochenschrift,* August 9, 1929

Coitus During Pregnancy, with Consequent Puerperal Infection.—L Ballin has conducted an inquiry into the frequency of coitus in pregnancy and its consequences Nearly all women interrogated admitted the practice and it is impossible to prove that the latter is responsible for abortion or any other ill effect. To condemn it, especially during the first five months, seems untenable as long as the woman is sound It is otherwise, however, if the woman have a retroflexion or infantile uterus, and in cases of habitual abortion the practice must be absolutely forbidden In the last four months coitus must be progressively diminished and after the eighth month discontinued outright for fear of causing premature rupture of the membranes It should not be resumed until from 4 to 6 weeks post partum at the earliest. This author is silent as to the possibility of puerperal infection, but in a companion paper by Bär the possible danger in this accident is shown by the narration of two cases—*Münchener medizinische Wochenschrift,* August 2, 1929

Hyperventilation—C Mandowsky of the internist clinic of Professor von Bergmann discusses the entire subject of forced respiration, which in time, by expulsion of carbon dioxide, leads to acidosis Many experiments on man and animals reveal that a large number of consequences may result, some of which have received much attention, such as tetany, epileptoid convulsions, and migraine, notably when a predisposition exists The author in mentioning his personal experience adds the following phenomena—temperature rise, lacrymation, lowering of blood pressure, and, in the hypertonic patient, various special crises—

is exerted upon the controlling neurons of the central nervous system, including both the motor and sensory portions of the reflex arc This action is elective and the inhibitions are removed both by direct stimulation and by increasing the susceptibility to stimuli Pathologically extinguished reflexes can be revived by small doses. But strychnine is also useful in cases in which there is no disturbance of reflex activity, and some of the activities of the drug imputed to its action on reflex functions may be otherwise explained Thus in cases in which it benefits enuresis the author has found no increase in the tonus of the muscles which are supposed to be in a state of paresis Rather does he believe that in such cases there is analgesia of the sensory nerves of the bladder Even if we accept the old belief, it is still probable that the sensory as well as the motor nerves may be acted on The author also mentions the efficacy of the drug in pollakiuria as somewhat paradoxical and as not explained by the reflex theory The drug is also a stomachic of proved value, yet its action on the motility of the stomach is weak or uncertain and its action on the gastric secretion is *nil* The good results in indigestion are imputed by the author to sedation of the sensory nerves A third condition in which we may invoke the same kind of explanation is that of extrasystole Finally the good effects in neurasthenia are with difficulty explained by the reflex theory—by tonic stimulation of the reflex arc That is to say, this explanation does not go far enough, to say the least We do not take account of the great disturbance of sensibility in the neurasthenic. A paralyzing or analgesic action on morbidly sensitive sensory nerves must be more and more thought of—*Deutsche medizinische Wochenschrift*, August 2, 1929

A New Hormone Excitant of the Central Nervous System—Prof L Haberlandt of the Physiological Institute of the University of Innsbruck contributes a preliminary communication, the full account of which will soon appear in *Pfluger's Archiv* After having begun work along a certain line, he learned in a personal interview that Prof Steinach was making investigations in the same direction, and he gives him all due credit for priority Beginning with frogs, he found that injection of an emulsion of the animals' brain substance caused a distinct stimulation in contrast with controls The experiment animals became livelier than normal and their muscle tone showed augmentation, and in decapitated animals reflex activity was increased The two activities, on the brain and cord, were not manifestations of one stimulation for some frogs who showed brain stimulation were not affected in their reflex actions A separate preparation of cord emulsion was also tested and it was found that the same hormone was present here and like the cerebral hormone was more active on the cerebral than the spinal cord functions An emulsion of the midbrain also revealed the presence of this hormone Other organ emulsions proved negative and the author is convinced that he is dealing with a specific principle and not a mere waste product The unknown substance is not a lipoid for it is soluble in water and therefore has nothing in common with cerebrin and other phosphatids Emulsions of brain from warm blooded animals also had the same positive action on the frog, but thus far the author has not made tests on animals other than the frog He has no doubt that he has found a new hormone, but thus far indulges in no speculations and makes no prophecies as to its future use in medicine—*Münchener medizinische Wochenschrift*, July 26, 1929

Vasomotor Syndrome of the Face—The presence of a foreign body in the midst of the tissues may cause a syndrome of excitation of the peripheral nerve fibers along with the vasomotor fibers The sympathetic and parasympathetic systems involved may give rise to phenomena of contradictory nature The foreign body involved may be visualized as ganglion, an irritant to some The author, Henry Proby, gives a case in point as follows A man aged 37 was wounded by a shell fragment in the right temporal region near the anterior margin of the external ear This happened in 1915 There was hemorrhage from the ear due to division of a branch of the temporal which was not ligated The following year a trismus developed from irritation of the temporal muscle but later wore off Then there appeared intermittent attacks of neuralgiform pain in the eye, ear, and face, tinnitus aurium, lacrymation, redness of the ear and cheek with gooseflesh sensations, and other manifestations, which however were all very brief There was a progressive shedding of the teeth in the right upper jaw Upon inspection the author found a marked atrophy of the right lower turbinal, right otorrhea, hypoesthesia in the retro-auricular and external orbital regions During the examination none of the irritative phenomena were in evidence, but at a later period a sharp headache appeared with sensations of a severe cold A röntgenogram, taken May 23, 1929, showed a small fragment of shell in the temporal fossa in contact with the bone a little above and to the rear of the bony orifice of the ear In addition to the irritative phenomena there was evidence of trophic influence in the turbinal atrophy and fall of the teeth Some of the critical phenomena were inhibitory in character, as absence of the nasofacial and ocular reflexes—*Journal de Médecine de Lyon*, July 20, 1929

Critical Sinusal Arrhythmia of the Nodal Rhythm.—Dr E Géraudel relates a case of this type of arrhythmia with a summary and general discussion and final conclusions, the

LEGAL

By Lloyd Paul Stryker, Esq
Counsel, Medical Society of the State of New York

MOTOR VEHICLES—FINANCIAL RESPONSIBILITY LAW

From comments which your counsel has heard from various persons outside the legal profession, it would seem that there is a great deal of confusion existing in the public mind as a result of a recent statute (Sec 94b Vehicle and Traffic Law) passed at the last session of the legislature, dealing with the suspension of an owner's or chauffeur's license for failure to satisfy a judgment obtained against him as a result of his negligence in the operation of a motor vehicle

There are a great many people who seem to be of the opinion that this statute is in effect a compulsory insurance law Such is not the fact. The law provides that where a final judgment in excess of one hundred dollars has been rendered by a court of competent jurisdiction, resulting from the ownership or operation of a motor vehicle, either personally by the owner, or by his agent, or by any other person, for whose negligence, he shall be liable or responsible, and such judgment shall remain unsatisfied at the expiration of fifteen days after the same has become final, the operator's or chauffeur's license and registration certificate in such event shall forthwith be suspended and shall so remain until the judgment is satisfied to the extent hereinafter noted If the judgment so recovered be in excess of five thousand dollars for an injury to one person in one accident, the suspension may be lifted by the satisfaction of the judgment to the extent of five thousand dollars or, if the judgment be in excess of ten thousand dollars for an injury to more than one person in one accident, the suspension shall be lifted by the payment of the sum of ten thousand dollars, and in the case of property damage, if the judgment shall be in excess of one thousand dollars, the suspension shall be lifted by the payment of the sum of one thousand dollars Provided, however, that the person against whom the judgment was procured gives sufficient proof of his ability to respond in damages for future accidents

The statute applies with equal force to non-resident motorists and provides that their privileges and rights to operate a motor vehicle in this state shall, in the event of an unsatisfied judgment, be suspended in exactly the same manner as a resident of this state

It will be noted, therefore, that the statute does not compel those operating private motor vehicles to take out insurance as a condition precedent to their right to own or operate a motor vehicle, but applies only in those cases where, through the negligence of the owner or operator of a motor vehicle, a judgment has been procured against him and such judgment remains unsatisfied

The number of those injured or killed yearly through the negligent operation of motor vehicles is appalling We are all familiar with the fact that in many instances the poor unfortunate whose health is ruined and whose usefulness is impaired, receives little or nothing as a result of the accident causing these injuries, either because the person causing them cannot pay or, as is all too frequently the case, because he has rendered himself judgment proof

The possession of a license to operate a motor vehicle is for many a business necessity It is to be hoped that this statute will have a salutary effect on every phase of the operation of motor vehicles In any event it is certainly a step in the right direction As the present Commissioner of Motor Vehicles, Charles A Hartnett has well said

"The new statute is designed to reduce the number of traffic accidents and increase the proportion of accident victims who receive compensation, as well as to keep the reckless driver off the road, at least until such time as he shall give evidence of his ability to meet a future judgment for damages"

OBSTETRICS—ACUTE NEPHRITIS RESULTING IN DEATH

A woman came to the defendant's office for examination, and he found her to be about six months pregnant The examination showed urine and blood pressure normal The woman was advised to return in another month for examination, but she did not return and nothing was heard from her until nearly three months after her first visit The woman's husband then called the doctor and asked him to come and see her, as he thought she was running over her time

headache, vertigo, angina pectoris, etc , various pains in special regions, changes in the normal reflexes, and certain psychopathic manifestations If we seek to characterize the total result of hyperventilation it becomes impossible to reduce it to formulæ Some of the manifestations are plus, others minus, in character The author, however, sums up some of the more significant results as follows when tetany is set up there is a diminution in the blood sugar and the same result appears in the diabetic, while if plenty of glucose is ingested tetany does not develop With temperature rise is seen excessive sweating, and sweating when there are pathological anomalies of the While, [illegible]-glands hyperventilation brings them out lowered, the [illegible] the stable, hypertonic blood pressure is tonic, in whom reverse is the case in the labile hyperated with headache, angina pressure may be associpains are seen, especially in the pectoris, etc , organ sometimes follow closely Head's zone abdomen, and rological symptoms the author mentions Of neutainty of the Babinski sign, and the change uncerslow response of the pupil to rigidity Outbreaks of a of their disease may occur in paralytics and schizophrenics —*Deutsche medizinische Wochenschrift,* July 12, 1929

The Sign of Edema of the Lower Eyelid in Urinary Retention.—Fodéré has collected a number of cases in which, although the subjects appeared to be in vigorous health and free from albuminuria, there was the coincidence of swelling of the lower lids with retention of chlorides and urea The age period of the patients was around fifty and there were fewer women than men When the author finds this sign present he does a venesection, places the patient on a restricted diet and gives a purgative, hoping thereby to avert more serious complications These patients are apt to go off suddenly The swelling is usually set down by the laity to a debauch, sexual excess, or the like, but it is seen chiefly in laborers, the overworked, and big eaters It is possible that valuable lives might have been spared if this little sign had been heeded and the author cites the case of Robert de Flers, author of the "Bois Sacré," in this connection, he had presented no evidence of nephritis, yet succumbed to what was probably acute pulmonary edema following an attack of congestion of the lungs It chanced that an assistant of de Flers' family physician had observed this edema of the lower lids as a forerunner of the catastrophe which carried off the celebrated dramatist Widal and Javal have written of the pre-edematous stage of this form of nephritis, based entirely on the blood determinations of urea and the phthalein test for renal permeability The author is inclined to place the most dependence on the latter It is on this background that the slight localized edema may appear as a clinical sign. In addition Dieulafoy left a remarkable description of the subjective sensations of this period which should be studied by the clinician, although they often pass unobserved. If this edema subsides under treatment it is a good prognostic sign.—*Bulletin de l'Académie de Médecine,* July 2, 1929

Status Thymicus—This subject, with the closely related one of so-called thymic death, is discussed by Professor J A. Hammar About the fact that the thymus undergoes involution precociously in comparison with other organs has sprung up a maze of theory One of the best defined of the anatomical constitutions is the status thymicus (thymico-lymphaticus) of which the essential element is the persistent thymus with the more or less constant presence of other anoetc [illegible]alies, as enlarged lymphnodes, narrow aorta, line between [illegible]rux of the entire matter is the dividing and a pathological thymus large within normal limits, bility to sudden death [illegible]ondition associated with hacourse known best for his [illegible]. Prof Hammar is of up" the elements which make method of "counting thereby visualizing its exact size. [illegible] up the thymus, its mass from the 3rd fetal month up. He has traced year, including all regressive changes [illegible] to the 90th persistence he regards as a purely norm. Thymus dition and mere size of a thymus is not an [illegible]mal contial feature The secondary hyperplasia [illegible]n essenorgan is a pathological condition in which [illegible] of the may not be of decisive significance. Certain mass the anatomical elements undergo increase, [illegible]m of sumably those which are also found in enlar[illegible] prelymphnodes The time has evidently gone [illegible]ged for attributing unexpected sudden deaths to by mere enlarged thymus, although the latter may be the secondary consequence of several basic states, like hyperthyroidism, which make for uncertainty of life Whatever these unknown anomalies may be, they are undoubtedly hereditary at times, for thymus death may be exquisitely familial Even if the increased thymus parenchyma were hostile to the economy it would be antagonized by some other incretion In so-called thymus death not enough attention has been paid to other incretory glands in which the primary mischief may inhere — thyroid, parathyroids, hypophysis, gonads, and adrenals —*Klinische Wochenschrift,* July 23, 1929

LONDON LETTER

London, October 1, 1929

Voluntary and Municipal Hospitals Upon the decision taken during the next six months will depend the future of hospital organization in this country As is well known, hospitals in Great Britain are of two kinds (1) the Voluntary Hospitals supported by voluntary contributions and staffed by unpaid part-time physicians and surgeons, and (2) the Municipal Hospitals maintained by public funds and staffed by whole-time salaried resident medical men. Under the terms of the Local Government Bill, 1929, which has now become law, the control of the Municipal Hospitals has been vested in the County Councils, their former authorities—the Boards of Guardians—ceasing to exist It is expected that the County Councils will institute a very wide measure of reform in the Municipal Hospitals now under their care, and the extent of the changes which will result is now and will be for some months a matter of the closest investigation It seems certain that two results will follow (1) there must be an addition to the number of beds available, and (2) there will be changes in the method of staffing the Municipal Hospitals

(1) In London there is no doubt a shortage of available beds The Municipal Hospitals are always full and there is always a long waiting list of applicants for beds at the Voluntary Hospitals so that early steps must be taken to relieve the pressure.

(2) It is probable that the County Councils will institute a system of part-time consulting Physicians and Surgeons on the staffs of the Municipal Hospitals, and it may be that the present whole-time resident staff will be replaced by short term residents as at the Voluntary Hospitals

This raises the very interesting question as to the source from which the consulting staff is to be obtained. Taking London as the example, are there enough physicians and surgeons, holding the necessary higher qualifications and not already on the staffs of the Voluntary Hospitals, to fill these vacancies? It is obvious that there are not enough, and there arises the question whether a member of the staff of a Voluntary Hospital can give the time to act as part-time consultant on a Municipal Hospital Staff This depends on the amount of time required, but if the work is to be done adequately, two half days a week at least will be necessary It seems that the solution of the difficulty lies in a close and friendly co-operation between the Voluntary and Municipal Hospitals It would be not only unwise but economically unsound for the State to ignore the Voluntary Hospitals, and to organize a service of its own independent of the Voluntary Hospitals From the economical standpoint it must be realized that throughout Great Britain there are 64,000 beds in Voluntary Institutions involving an expenditure of about £9,000,000 a year which is subscribed by the charitable public for their maintenance And this £9,000,000 a year includes nothing for the services of the visiting staffs, who are unpaid If the voluntary system is abandoned these beds must be provided by the State (it costs between £800 and £1,000 per bed to build a hospital in England), this huge income will be lost, and, as the staffs will be paid under State control, the yearly cost of £9,000,000 will be vastly increased But perhaps a more important consideration is the provision of medical education, at present undertaken entirely by the Voluntary Hospitals In any scheme, undergraduate and postgraduate education must be safeguarded.

Psychoanalysis The discussion on psychoanalysis at the Manchester meeting of the British Medical Association has once more emphasized the divergence of opinion in the profession as to its value A special committee of investigation has been considering the subject for two and a half years, and it was on the report of this committee that the discussion arose Even the committee refused to make any general pronouncement, and the discussion, which was not very enlightening nor altogether free from prejudice, did not do much to clarify the muddle Our profession is notoriously reactionary, and history tells us that many brilliant discoveries were met with hostility and derision It is probable that the acceptance of the sexual element as the main cause of neuroses will always be opposed, but it is interesting to notice how the "jargon" of the cult is creeping into the ordinary conversation of the laity Such words as "repression," "inhibition" and the "inferiority complex" are used by journalists with reference to commonplace happenings with a reckless abandon which makes one almost forget that a few years ago the terms were not known We must watch the growth of this rather vigorous plant remembering as someone caustically said "even the roses grow out of dirt and are better for manure!"

H W Carson, F R C P

The doctor went to the woman's home, and found her up and about the house An examination disclosed no dilatation, the child was alive and in normal position The doctor advised the woman and her husband that she would probably deliver in a few days, and that she should immediately go to the hospital She did not, however, go to the hospital, but the husband said he would notify the doctor when she was having pains

Several days later the doctor was again called to the woman's home She had a nurse who reported to the doctor that the woman's vision was being affected The urine analysis which was immediately made showed the presence of precipitated albumin The woman was immediately taken to the hospital, and the defendant called a consultant, and after examination it was decided to do a Caesarian section The woman was put under a general anesthesia, and the consultant did a Caesarian section and removed the child. The baby lived only a day

The mother, as soon as she was delivered, began bloating up Enemas were administered, but the patient did not respond and she developed pulmonary œdema, intestinal stasis, a slight sepsis, and the kidneys refused to function Another consultant was called in who approved of the treatment already given, but the patient did not improve and died about a week after delivery, the cause of death being given as acute nephritis

Subsequently, an action was brought claiming that the woman's death was due to the defendant's negligence in treating the case After the doctor's answer had been filed, the plaintiff noticed the case for trial but shortly before it was to be actually reached on the trial calendar, it was discontinued, thus terminating the action in the doctor's favor

HERNIA—INFECTION—REMOVAL OF TESTICLE

A man about 45 years of age called at the hospital where the defendant was an attending physician, complaining of pain in the right side An examination disclosed that the patient was suffering from a right oblique inguinal hernia The defendant advised an operation and the patient consented At the operation it was found that there was a congenital hernia with a thickened sac about one-half inch thick It was necessary to completely dissect this before it could be transplanted Part of the thickened sac was left around the testicle Drain was inserted in lower angle of the wound This drain was removed in forty-eight hours About a week after the operation the patient complained of pain in the right side and there was a rise in temperature On examination it was found that the scrotum was very much enlarged, painful and at the upper end there was definite fluctuation Under a local anaesthetic the defendant incised the scrotum in its lower angle and about half an ounce of chocolate colored material was evacuated The doctor continued to dress the wound daily, but before the infection had cleared up, the patient left the hospital against the doctor's advice

The doctor saw the patient twice after this at his home, at which time he dressed the scrotum The condition not improving, the patient was advised to return to the hospital This he did and the defendant called in a consultant who advised that the right testicle be removed, it having become necrotic. The patient's consent was obtained, and under a general anaesthetic the scrotum was incised and a large mass of infected and necrosed tissue was removed The right side of the scrotum was packed with iodoform packing After this the scrotum healed nicely and the patient was able to leave the hospital and go to the doctor's office for dressings When the doctor last saw the patient the scrotum had healed

Subsequently the patient began an action charging the doctor with negligence and carelessness in the operation and also that the plaintiff's testicle had been removed without consent

After the commencement of the action, however, the plaintiff took no steps to bring it to trial and finally it was dismissed for lack of prosecution, terminating the matter in the doctor's favor

Dr Joseph S Laurence, State Executive, presented the "Value of the County Society to the individual member"

Thirty-three members were present and took part freely in the discussion that followed the addresses

It was decided to hold a special meeting in November that we might go more in detail into the subjects presented

This was one of the most profitable meetings ever held by the society

A. H BROWNELL, *Secretary*

WASHINGTON COUNTY

The special feature of the meeting of the Washington County Medical Society which was held on May 14, was the authorization of an engraved memorial to Dr S J Banker of Fort Edward, on the occasion of the doctor's reaching the 50th year of his practice The memorial which was engraved and framed reads as follows

"The Medical Society of Washington County, State of New York, in recognition of the long, honorable and faithful service of Dr Silas J Banker presents this token of the confidence, appreciation and affection of its members

"We feel that the medical profession and the public have been benefited by his fifty years of practice and that our society has been favored by having as one of its leading and most active members for many years a man of such ability and sterling qualities of heart and mind Since 1907 he has served as our efficient and accurate secretary, thereby enhancing the standing of the society throughout the state and adding greatly to the advantages of us all"

This memorial was presented to Dr Baker on June 28, by a committee consisting of Dr Russel C Paris of Hudson Falls, Dr Samuel J Pashley of Hudson Falls, and Dr William L Munson of Granville.

The annual meeting of the Medical Society of the County of Washington was held at Hudson Falls October 1, 1929 at four o'clock

The members present were Drs Bennett, Paris, Banker, Samuel Pashley, Samuel Pashley, Jr, Tillotson, Rogers, Cuthbert, Macarthur, Munson, Borrowman, Hulsebosch, Oatman, Leonard, Holmes, Vickers, Prescott Visitors Dr Carl Boettiger of New York City, Dr Victor M Bergstrom from the State Department of Health, and Dr Albert Chapman of Glens Falls

Dr Paris reported for the Committee on the memorial to Dr Banker, and moved that the text of the memorial be spread upon the minutes

The following officers were elected

President, R E LaGrange, Vice-President, B C Tillotson, Secretary, S J Banker, Treasurer, R C Paris, Censors, D M Vickers, A E Falkenbury, Samuel J Pashley, Jr, Delegate to the State Society, W S Bennett

The President appointed the following committes Legislative Committee Drs Leonard, Macarthur and Munson Public Health, Public Relations and Physical Therapy Committee Drs Rogers, Leonard, Munson, Macarthur and Samuel Pashley, Jr

Dr Munson gave a résumé of the Fourth District Branch meeting, of which he is the president.

The following scientific program was carried out President's Address—"Economic changes during the past half century, and how they have affected the physician" Dr Macarthur read a paper on "Bacillary Dysentery" Dr Victor M Bergstrom, from the State Board of Health, gave a paper on Undulant Fever, which was discussed at length Dr Carl Boettiger, Chief of the Medical Service of St John's Hospital, Long Island City, read a paper on the "Recent Progress in the Treatment of Pneumonia," which was well received and discussed

S J BANKER, *Secretary*

THE MEDICAL INTERPRETER

The medical interpreter was a quarterly medical journal which contained abstracts from other medical journals, and was designed to supply general practitioners of medicine with authoritative information regarding the current progress in all branches of emdicine It was similar to the department of Medical Progress in the NEW YORK STATE JOURNAL OF MEDICINE It was edited by Dr Albert Allemann, Principal Assistant Librarian, Surgeon General's office, U S Army, assisted by prominent officers in the Army, Navy, and U S Public Health Service, but it was published by a business corporation which was evidently not financially successful for the journal is no longer published, but the former publishers are disposing of the volumes already on hand

Dr Allemann has written to the *Journal of the A M A* and to the State Journals, asking that they print the following notice

"I wish to inform the subscribers of the *Medical Interpreter* that I have resigned as editor of this publication in December, 1928, and that I am no longer responsible in any manner for the actions of its promoters"

On checking up this information, the editors have found that this notice has been accepted for publication in the *A M A Journal* and in several State Journals

NEWS NOTES

MEDICAL FEES, UNITED STATES ARMY

The War Department at Washington has issued a lengthy schedule of fees for hospitalization and medical treatment for the personnel of the National Guard This schedule has been reprinted as Bulletin No 4 of the Adjutant General's office of the State of New York, dated May 24, 1929 It gives in detail the fees which will be paid to civilian physicians for attending the officers and enlisted men for sickness and injuries sustained by officers and enlisted men, when the official physicians and hospitals of the Army are not available This fee list will be of practical value to the few physicians of New York State who may attend the officers and enlisted men of the National Guard It is also of interest to all physicians, for it is an example of the growing tendency toward the establishment of standard fee lists by official agencies and business organizations (See the fee list for the care of crippled children printed on page 170 of February first issue of this JOURNAL) The fees of the Army list are the maximum amounts to be allowed, and in this they are in contrast with many other fee lists which are minimum charges The schedule may be obtained by application to the Adjutant General's office, Albany, N Y

HERKIMER COUNTY

The third quarterly meeting of the Medical Society of the County of Herkimer was held at the Hotel Waverly in Herkimer, Tuesday, September 3, 1929, with the first Vice-President, Dr V M Parkinson of Pine Crest, in the chair

Reports were given by Dr F H Moore for the Executive and new By-Laws Committees Many meetings of these Committees had been held since the June meeting of the Society requested a report on new By-Laws After much consideration a complete sew set of By-Laws has been proposed and handed in to the Society for its further consideration and ultimate adoption The principal features of the proposed changes are

1 Increase from quarterly to bi-monthly meetings except during summer months

2 Appointment of Executive Committee comprising the President and at least two past Presidents with a total of seven members who are to be nominated by the President-Elect at the annual meeting and confirmed by the Society at the same meeting This Committee is to meet regularly previous to the Society's meetings, go over all of the matters pertaining to the welfare of the profession and recommend a program of action. They are also empowered to act for the Society until such action is rescinded in meeting of the Society

3 Addition of publicity, membership, program and obituary committees to already existing standing Committees The program Committee to comprise the three Vice-Presidents

These proposed changes in By-Laws must be approved by State Society before adoption and necessary expenses of printing, etc., were approved

A resolution was adopted authorizing an official transcript of medical testimony at local malpractice suits and the consideration of same by the Executive Committee, when members of the profession testify for the plaintiff

The customary address by one of the Vice-Presidents was given by Dr H C Murray of Herkimer on poliomyelitis

Motion pictures were shown by Dr A L. Fagan of his recent trip to the Pacific Coast

Officers were nominated for election at the annual meeting in December An excellent supper was served at 6 30 and adjournment taken at 10 30 p m

W B BROOKS, *Secretary*

OTSEGO COUNTY

A most inspiring meeting of the society was held on Tuesday, October 1st, at The Oneonta Country Club

Dr James N VanderVeer, President of the State Society, gave an address that touched upon various matters that confront the medical profession at the present time He showed the need and value of insurance against malpractice, the need that preventative medicine should be under the control of the profession and not in the hands of the lay organizations, the need of a uniform fee bill, the condemnation of fee splitting, and the value of an auxiliary organization made up of the wives of the medical men He also discussed the propaganda, now so much in the daily press, regarding the high cost of medical practice

of exhaust pipes on motor buses operated under certificates of public convenience and necessity Almost all of the major operators of bus lines in the state were represented No contention arose regarding the possibility that the exhaust gases are deleterious Nearly every one agreed that provision should be made to minimize, if not eliminate, the possibility of these gases coming inside the bus

"In the opinion of the majority, this would be accomplished best by carrying the exhaust pipe to the extreme rear of the body and projecting the end downward at a 45 degree angle Several of the bus representatives said at that time that their lines were installing hot water systems

"Within the last year, it was said, the asphyxiation of passengers in motor buses through the escape of motor gases has been reported to the commission on several occasions In some instances, it was said, the gases reached the body of the vehicle from the exhaust pipes under the body through the flooring or the side panels"

THE EVOLUTION OF NOISE

Everything is recorded now-a-days, even to the noises of the City, which are recorded in the complaint books of the Department of Health An editorial in the *New York Herald Tribune* of October 3 makes the following comments on the changing character of the noises

'The constant complaints of a few decades ago referred to hucksters' cries (which could hardly be heard in the din of present-day automobile traffic), to the old-fashioned squeaky German bands, to the rattle of iron-wheeled carts over cobblestones, to piano practice at night People still complain, as ineffectively today as years ago, of the too early milk wagon, of the too casual slinger of garbage cans, of barking dogs and rattling restaurant dishes, but the burden of 1929 complaints refers to impatient automobile horns, shrieking brakes, neighbors' radio sets and the internal din of the steam riveter

"If Dr Wynne's experts make a really up-to-date study, they will include the roar of airplanes in their findings, and if they take as long as some experts do they may discover that New York is breeding a race acclimated to noise Many a tenement child has complained that he could not sleep in the silent country night Perhaps we are developing a race which will demand the friendly companionship of elevated trains, radio sets, subway turnstiles and pneumatic riveters, and will complain that it cannot work without them"

FLAVORS OF MUCILAGE

Those doctors who are still compelled to lick their own postage stamps and envelopes will be interested in an editorial in the *New York Times* of October 2 describing some vandalisms in Tangier where movie posters of both French and Spanish plays were stored The French ones were found mutilated every morning, while the Spanish ones were untouched The *Times* says

"The truth came out when one morning early a policeman discovered a herd of goats placidly breakfasting on the hoardings while their master round the corner was marketing fresh milk from the animal he had kept by him To account for the choice of French rather than Spanish posters, it was suggested that the goats preferred the gayer colors and spicier flavor Careful investigation, however, proved that the French glue smelled and tasted of honey, while the Spanish was the usual flavor A judicious use of bitter-almond drops saved the situation

"Our own Postoffice Department which is said to be contemplating the adoption of a pleasanter stamp glue, might do well to send for samples of the French honey brand"

SOURCES OF QUOTATIONS

The department of this JOURNAL called 'The Daily Press" contains comments on the medical aspects of the news of the day, and great care is taken to ascribe every quotation to its source However, the brief reference to marihuana on page 1161 of the issue of September 15 was ascribed to the *New York Sun*, instead of the *Herald Tribune* from which it was actually taken The *New York Sun* in a most courteous note disclaimed the paternity of the article, seemingly to its regret However to us the mistake afforded the satisfaction of finding that our JOURNAL is being read in the sanctum of a leading metropolitan daily

THE DAILY PRESS

AN ANGLE WORM FARM

FISHING is a favorite avocation of physicians and they will be interested in the following account of an angle worm's farm on the editorial page of the New York Times of September 19

"The climate of California has proved ideal for raising bumper crops of oranges and lemons, tennis players and tourists Now it appears that it is equally good for producing wholesale quantities of angle worms Although this infant industry is only in its fourth year, the 1929 crop has reached the staggering figure of 300,000 worms, with the season but half over

"This bait of the fisherman is raised on a farm in Alhambra Four years ago the owner managed it single-handed, but now he needs five men to help him care for his constantly increasing live stock The earthworms are fed entirely on corn meal When ready to be sold they are packed in moss 'in tins resembling large pepper cans' In these containers it is said they will live six weeks or more with no further care

"The proprietor gives his charges a very good character They are peaceable, industrious and monogamous In two years' time a worm reaches maturity, and some have been known to live to the age of twenty

"The present output of the farm is almost large enough to supply half of the entire demand of the United States With the long weeks of drought this year, and local worms burrowing deeper and deeper for moisture, the farm had more orders than it could fill Since fishing has come to be the sport of Presidents, the angle-worm business should look for a brisk and immediate increase Every one of the million baby worms now fattening on the Alhambra farm should find an eager buyer next year"

Physicians addicted to fishing will also be interested in what Izaak Walton says about the toilet and diet of angle worms and the means taken to ensure their health and vigor They will also relish Izaak's plea that the fishermen be kind and gentle while impaling a worm or frog on a hook so as to give the creature as little pain as possible

Speaking of earth worms, physicians will be interested in an article in the September Scientific American on the discovery of ancient Roman Camps in England by means of photographs taken from airplanes The photographs show the outlines of walls and pavements buried several feet beneath the surface of the soil The reason for their burial, although it is not mentioned in the article, is given in one of the first books written by Charles Darwin It is on "The Formation of Vegetable Mold", and records his patient observations of the amount of soil cast upon the surface by earth worms, and his descriptions of Roman pavements buried by the action of the worms

---

CARBON MONOXIDE ON CITY STREETS

THE New York *Sun* of September 18 quotes Mr Samuel Brown as saying

"The carbon monoxide spewed forth by automobiles is particularly pernicious and injurious to the health of the citizens of New York This is due particularly to the fact that it does not dissipate quickly, but stays about two feet from the ground, owing to the lack of wind movement at that height

"I have often wondered how the New York traffic policemen are able to stand the fumes The gas saturates their clothing and lungs, and it is hard on the constitution—and they have to put up with it for eight hours a day It also affects pedestrians, and it is a health problem that must be solved, especially in view of the city's increasing population"

The New York *Herald Tribune* of September 18 prints an order of the New York Public Service Commission barring the use of the motor exhaust gases for heating public buses The Herald Tribune says

"The ruling goes into effect in January 1, 1931, for buses now in use, on December 1, 1919, for new buses This step was taken to eliminate the peril to passengers of poisoning by carbon monoxide, generated in the exhaust While all buses are not heated by the diversion of the exhaust, this device is used in the majority of cases Automotive engineers consider it more practicable and easier than to use water heated in the radiators

"The Public Service Commission conducted a hearing last June to inquire into the location

of exhaust pipes on motor buses operated under certificates of public convenience and necessity Almost all of the major operators of bus lines in the state were represented No contention arose regarding the possibility that the exhaust gases are deleterious Nearly every one agreed that provision should be made to minimize, if not eliminate, the possibility of these gases coming inside the bus

"In the opinion of the majority, this would be accomplished best by carrying the exhaust pipe to the extreme rear of the body and projecting the end downward at a 45 degree angle Several of the bus representatives said at that time that their lines were installing hot water systems

"Within the last year, it was said, the asphyxiation of passengers in motor buses through the escape of motor gases has been reported to the commission on several occasions In some instances, it was said, the gases reached the body of the vehicle from the exhaust pipes under the body through the flooring or the side panels"

THE EVOLUTION OF NOISE

Everything is recorded now-a-days, even to the noises of the City, which are recorded in the complaint books of the Department of Health An editorial in the *New York Herald Tribune* of October 3 makes the following comments on the changing character of the noises

"The constant complaints of a few decades ago referred to hucksters' cries (which could hardly be heard in the din of present-day automobile traffic), to the old-fashioned squeaky German bands, to the rattle of iron-wheeled carts over cobblestones, to piano practice at night. People still complain, as ineffectively today as years ago, of the too early milk wagon, or the too casual slinger of garbage cans, of barking dogs and rattling restaurant dishes, but the burden of 1929 complaints refers to impatient automobile horns, shrieking brakes, neighbors' radio sets and the infernal din of the steam riveter

"If Dr Wynne's experts make a really up-to-date study, they will include the roar of airplanes in their findings, and if they take as long as some experts do they may discover that New York is breeding a race acclimated to noise Many a tenement child has complained that he could not sleep in the silent country night Perhaps we are developing a race which will demand the friendly companionship of elevated trains, radio sets, subway turnstiles and pneumatic riveters, and will complain that it cannot work without them"

FLAVORS OF MUCILAGE

BOOK REVIEWS

NEPHRITIS Its Problems and Treatment. By T IZOD BENNETT, M.D (London), F.R C P Octavo of 94 pages. New York, Oxford University Press, 1929 Cloth, $1 85 (Oxford Medical Publications)

This volume of ninety-five pages is based on three lectures delivered before the Royal College of Physicians in 1928, in which the problems of uremia, of edema and of hypertension were presented The author has added a chapter on the classification of nephritis, and one on the treatment of nephritis, in order to present a more harmonious survey of the subject. This volume is a carefully prepared treatise on a subject which is difficult to present and includes the modern knowledge on the subject, as well as the author's experiences and conclusions In this small volume we have an excellent picture of the problems presented to one who treats patients having pathological conditions in the kidneys Study of this book will well repay the time taken for its perusal.

HENRY M. MOSES.

MEDICAL CLINICS OF NORTH AMERICA. Vol 12, Nos 1 to 5 Published every other month by the W B Saunders Company, Philadelphia and London. Per Clinic Year (6 issues) cloth, $16 00, paper, $12 00 net.

Volume 12, Number 1, July, 1928, (Chicago Number)

This is a Chicago number and contains such interesting material as primary carcinoma of the lung, lymphocytosis in infants, visceral neurology, erythema nodosum of childhood, coronary disease, the use of synthalin in diabetes, the clinical significance of electro-cardiography, behavior problems in children, chronic hemolytic icterus, and many others of great value.

Volume 12, Number 2, September, 1928 (Nebraska University Number)

This is an excellent number by the University of Nebraska group of clinicians covering among others such topics as hypothyroidism, gastrojejunal fistulae, subacute bacterial endocarditis, pulmonary tuberculosis, otitic brain abscess, chronic infectious arthritis, and vomiting in children.

Volume 12, Number 3, November, 1928 (New York Number)

This is a New York number of exceptional value. Dr Nellis B Foster gives a resume of diagnosis and treatment of nephritis Dr Bela Schick discusses tuberculosis in children and illustrates it with many x-ray plates. There is an interesting article on obesity by Dr Henry Spencer, a differential diagnosis of chest pains and its therapy by Doctors Guion and Meara. Endocrine angina as a medical entity is described by the above authors In addition, Dr I W Held and Dr A A Goldbloom give a complete description of hematologic diseases These are but a few of the many valuable articles that can be mentioned

Volume 12, Number 4, January, 1929 (Philadelphia Number)

A Philadelphia number of great merit. Among the many valuable papers, one can only mention a few, such as coronary disease, myeloid leukemia, hyperacidity hyperthyroidism jaundice, the prostate as a source of focal infection, hypoglycemia, liver abscess and the use of dextrose in the treatment of obesity

Volume 12 Number 5 March 1929 (Southern Interurban Clinical Club Number)

This number was compiled by the Southern Interurban Clinical Club It contains among others interesting works on pellagra, tropical sprue, cardiothoracic distress, amebiasis, thyroid deficiency as a cause of poor health, induced syphilitic meningitis, Wilson's disease and sickle-cell anemia.

JOSEPH S BENDETSON

INJECTION TREATMENT OF INTERNAL HEMORRHOIDS By MARION C PRUITT, M D 12mo of 137 pages, illustrated St Louis, The C V Mosby Company, 1929 Cloth, $3 00

British medical literature always impresses the reader with its clarity and directness Although transplanted to a new soil the fruit of Dr Pruitt's labor bears the impress of his English training

The injection treatment of hemorrhoids has come to stay and will undoubtedly occupy a more prominent place as years go by

We would advise those who are interested to read this little book of 137 pages which gives all the necessary information in a direct and thorough way

HENRY F GRAHAM

RECENT ADVANCES IN PSYCHIATRY By HENRY DEVINE, O B E., M D 12mo of 340 pages Philadelphia, P Blakiston's Son & Company, 1929 Cloth, $3 50 (Recent Advances Series)

Although a comparatively small volume it covers many phases of psychiatry In the introduction attention is called to the fact that we have lately come to consider the term insanity to cover only a small number of behavior disorders After taking up at some length the effect of toxic and somatic factors in mental disease, including germ plasm taints with inherited predisposition, the author discusses and compares the somatic and psychogenic syndromes, and points of similarity between physical and psychic irritants He stresses the importance of studying both physical and psychic phases of the reactions, and reviews some of the work on the relationship of focal infections to mental symptoms, and the effect of intercurrent disease upon the course of mental ailments This leads quite easily to what is termed "shock" therapy and malaria treatment of general paralysis With reference to the behavior of the organism in mental disease the hemoclastic crisis and the variations of metabolism are considered

Three chapters on biopsychic types include a study of biogenetic psychoses (Dementia Praecox and Manic Depressive), Kretschmer's physical types and some recent contributions to the study of pathology, particularly of the endocrines in the biogenetic disorders The last four chapters are devoted to a discussion of psychology of the psychoses, including psychogenesis and reference to the psychological interpretation of symptoms and psychotherapeutic measures Throughout emphasis is laid upon the importance of closer and closer relation between psychiatry and general medicine, to the end that prophylaxis and therapy may both be more effective.

A. E. SOPER.

THE INJECTION TREATMENT OF HEMORRHOIDS By Dr CHARLES CONRAD MILLER. 12mo of 124 pages, illustrated Chicago, Modern Surgery Publication, 1929

This is a valuable little hand book giving in a didactic and practical way all the essential information to enable one intelligently to use this method of treatment

Indications, contraindications solutions, methods of injecting, pathological changes produced complications and sequelae are all discussed in sufficient detail

We can recommend this book to all who are interested in hemorrhoids.

HENRY F GRAHAM

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review, as dictated by their merits, or in the interests of our readers.

GYNECOLOGY A Text-book of the Diseases of Women By LYNN LYLE FULKERSON, A.B, M D Octavo of 842 pages illustrated. Philadelphia, P Blakiston's Son & Company, 1929 Cloth, $9 00

PROCEEDINGS FIRST COLLOQUIUM ON PERSONALITY INVESTIGATION Held Under the Auspices of the American Psychiatric Association, Committee on Relations with the Social Sciences Octavo of 102 pages New York City, December 1-2, 1928 Balt., Lord Baltimore Press, 1929 Paper, 60c,, Cloth, $1 00

INTERNATIONAL CLINICS Edited by HENRY W CATTELL, A.M., M D Thirty-ninth Series, Volume II Octavo of 305 pages, illustrated Philadelphia and London, J P Lippincott Company, 1929

THE CONQUEST OF CANCER BY RADIUM AND OTHER METHODS By Daniel Thomas Quigley, M D, F.A.C.S Octavo of 539 pages, illustrated. Philadelphia, F A Davis Company, 1929 Cloth, $6 00

OSTEOMYELITIS AND COMPOUND FRACTURES AND OTHER INFECTED WOUNDS Treatment by the Method of Drainage and Rest. By H WINNETT ORR, M.D, F.A.C.S Octavo of 208 pages, illustrated St. Louis, The C V Mosby Company, 1929 Cloth, $5 00

CLINICAL LABORATORY METHODS By RUSSELL LANDRAM HADEN, M A., M D Third Edition. Octavo of 317 pages, illustrated St. Louis, The C V Mosby Company, 1929 Cloth, $5 00

PRINCIPLES AND PRACTICES OF ELECTROCARDIOGRAPHY By CARL J WIGGERS, M D Octavo of 226 pages, illustrated. St. Louis, The C V Mosby Company, 1929 Cloth, $7 50

OTOSCLEROSIS A Resume of the Literature to July, 1928. Compiled under the Direction of the Committee on Otosclerosis, American Otological Society ARTHUR B DUEL, M D, Editor Two octavo volumes of 684 pages New York, Paul B Hoeber, Inc, 1929

GONORRHEA AND KINDRED AFFECTIONS Gonorrhea in the Male Cnancroid and Verruca Acuminata, by GEORGE ROBERTSON LIVERMORE, M D, F.A.C S, and Gonorrhea in the Female, and the Infectious Granulomata, by EDWARD ARMIN SCHUMANN, A.B, M D, F.A C S Octavo of 257 pages, illustrated New York and London, D Appleton & Company, 1929 Cloth, $5 00

PRACTICAL MATERIA MEDICA An Introductory Text to the Study of Pharmacology and Therapeutics Designed for Students of Medicine. By CLAYTON S SMITH, Ph.D, M D, and HELEN L WIKOFF Ph D 12mo of 300 pages Philadelphia, Lea and Febiger, 1929 Cloth, $3.25

RICKETS INCLUDING OSTEOMALACIA AND TETANY By ALFRED F HESS, M D Octavo of 485 pages, illustrated Philadelphia, Lea and Febiger, 1929 Cloth, $5 50

THE AMERICAN ILLUSTRATED MEDICAL DICTIONARY A Complete Dictionary of the Terms Used in Medicine, Surgery, Dentistry, Pharmacy, Chemistry, Nursing, Veterinary Science, Biology, Medical Biography, etc., with the pronunciation, derivation, and definition. By W A. NEWMAN DORLAND, A M., M.D 15th Edition, revised and enlarged. Octavo of 1427 pages, illustrated Philadelphia and London, W B Saunders Company, 1929 Flexible binding, plain $7.00 net, thumb index, $7 50 net.

HERMAN'S DIFFICULT LABOR. A Guide for Students and Practitioners Seventh Edition, revised by CARLTON OLDFIELD, M.D (Lond.), F.R.C.S (Eng) 12mo of 560 pages, illustrated. New York, William Wood & Company, 1929. Cloth, $5 50

ORTHOPEDIC SURGERY By Sir ROBERT JONES Bart, K.B E, C B, and ROBERT W LOVETT, M D, F.A.C.S Second Edition, revised Octavo of 807 pages illustrated. New York, William Wood & Company, 1929 Cloth $11 00

THE TREATMENT OF FRACTURES By LORENZ BÖHLER M.D Authorized English translation by M E Steinberg, M S, M.D Octavo of 185 pages, illustrated Vienna, Wilhelm Maudrich, 1929 Cloth, $5 00

THE BEST WAY
To
Feed A Baby

There are many methods of artificially feeding babies. Often the physician asks—What is the best way?

The Answer:

There are no standardized babies and therefore no standardized foods are suitable for all babies. The requirements of the individual baby must be considered.

This is why the formulas of Mead's Dextri-Maltose, cow's milk and water are most popular with a majority of physicians, because these formulas can be regulated to suit the requirements of the individual baby.

First Thought—Breast Milk.

Second Thought—Mead's Dextri-Maltose, Cow's Milk and Water.

Scientific literature and a supply of Dextri-Maltose for clinical observation will be furnished on request.

Total cash receipts from all sources	8,152 06
Total amount paid Treasurer	8,152 06

The question of dues came up in connection with the annual budget which was adopted as follows

APPROPRIATIONS

Publication	$14,000
Welfare	750
Credentials	400
Executive Secretary and Editor salary	10,000
Executive Secretary, office rent	1,000
Executive Secretary, office furniture	500
Executive Secretary, office expenses	2,400
Executive Secretary, travel	2,000
Field Secretary salary	4,000
Recording Secretary salary	1,500
Recording Secretary, expenses	750
Recording Secretary, office	1,650
Treasurer's expenses	100
A M A Delegates	800
Legal	1,000
Printing and Stationery	1,800
Tri-state Conference	150
County Secretaries' Conference	150
Contingent Fund	2,500
Reserve	3,000
	$48,450

This budget was adopted after a considerable discussion on raising the State dues from $10 00 to $15 00 The secretary reported that the Society now has 2,522 members The table of expected income as stated in the budget is as follows

INCOME

Balance	$ 200
Assessment	39,000
Publication	8,500
Interest	750
	$48,450

The report of the Editor and Executive Secretary, Dr H O Reik, contained a number of questions regarding policies of the Society These questions and the action of the Committee to whom they were referred, were as follows

Are you satisfied with the progress of the Journal? What changes do you desire?

The committee is of the opinion that our Journal ranks among the best of the state journals of the country and should be continued upon the same high plane as in the past, encouraging the Editor and Publication Committee to make such additions or improvements as seem advisable

(*Continued on page 1294—adv xii*)

(Continued from page 1294—adv xii)

counsellor and it is best to leave this question to that committee.

Is it desirable to have a "fact finding" investigation of alleged unprofessional conduct?

It does not seem advisable, to your committee, to have such special investigation by any special action on the part of the Society The questions of fee-splitting, relationship between physicians, advertising, etc, should be carefully watched by each county society and if of sufficient importance referred to the Councillors of the State Society

What shall be our attitude toward national legislation described Sheppard-Towner law, Narcotic law, higher tariff on surgical instruments?

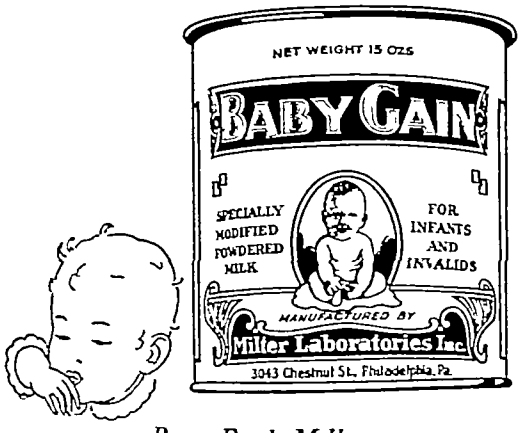
Inasmuch as the Welfare Committee and the state committees are opposed to all three forms of legislation, the Medical Society of New Jersey should go on record as opposed to these laws in their present form

The Field Secretary, Mrs Ethel C Taneyhill made a detailed report on her activities, which consisted largely in giving sixty-nine addresses before audiences totaling 6,275 persons, and consisting largely of Woman's Auxiliaries and Parent-Teachers Associations Mrs Taneyhill had also acted as secretary of the executive council of the Committee for the Prevention of Diphtheria.

CHOOSING A FAMILY PHYSICIAN

The *Daily News* of Jackson, Mississippi, in its issue of June 4, tells its readers how to choose a family doctor The article is quoted in the August issue of the *New Orleans Medical and Surgical Journal* as follows

"Magazines of the day are replete with articles advising the public how best to invest their money All very good Even more pertinent is the security of health and life You understand the purchase of stocks and bonds, but do you know how to buy yourself a doctor?



"You have Dr Jones because he belongs to your church Dr Smith is an examiner for your lodge Dr Brown is a good patron of your bank Wonderful security? How much money would you lend him on the strength of it?

"Yet you freely entrust to his custody the health and lives of yourself and family 'What fools we mortals be?'

"Do you know aught of his education? Where he practiced before entering your community? Why he left? No, you don't know any of these things You assume that he passed the State Board of Medical Examiners and has a license to practice medicine in your state. All right as far as it goes

"How then shall we select a family physician?

Pure, Fresh Milk
From Healthy, Tuberculin-Tested Cows,
Modified and Powdered

MILTER LABORATORIES, Inc.
Dept. D, 3043 Chestnut Street, Philadelphia, Pa.

Please send me free sample can of BabyGain and descriptive literature.

Doctor

Address

With BabyGain, Uniform Modifications are easy to prepare—

One of the difficulties with bottle feeding is the frequent variation of home modifications compared with the constancy of breast milk

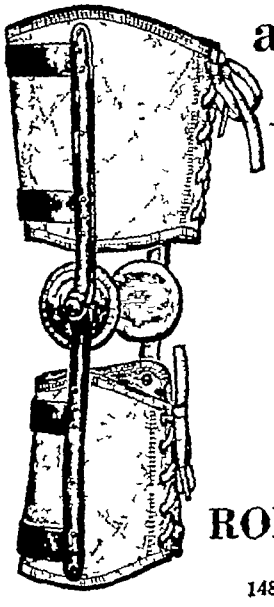
The simplicity of preparing BabyGain appeals to the mother, and the physician's instructions can be more reliably carried out

BabyGain offers a proven well-balanced formula and is easy to assimilate and digest

The only fat in BabyGain is the natural butterfat in the pure fresh Tuberculin-Tested milk from which it is made

The Follow-Thru Of Your Instructions

THE physician who prescribes exercise for his patients is generally too busy to follow thru his instructions to see whether the prescription is being carried out—or neglected



The physician who takes the extra precaution of sending a client to McGovern's Gymnasium for exer... letter, and ... and re building has the assurance that his patient by regular ... escription is being carried out to the A work out at McGovern's wan follow the progress of his many physicians send patients here to send you a guest card ... you why so ... be glad

Shall we endeavor to make it an ideal state society journal, as described at the conference of officers of New York, Pennsylvania and New Jersey medical societies, even if cost be increased?

Make the Journal as nearly ideal as is possible, together with such desirable additions as the budget will justify

Have you any suggestions to make regarding the Woman's Auxiliary?

This movement should receive the strongest endorsement of the Medical Society of New Jersey and each county society should be instructed to give every assistance and encouragement to the women in making their work effective, instructive and interesting

Any suggestions regarding work of Field Secretary?

The excellent work done by our Field Secretary during the past years has been most effective and should be continued by the Society Her activi... should be governed by Dr Reik and the Wel... casting progr... mmittee

...tinue the State So... ask county societies to start broad

Each county society ... of their own? *Shall we con*... lege of broadcasting a series ... *radio talks?* its nearest radio station should ... n obtain the priv... such opportunity Before initiating ... health talks over ... casting, its committee should obtain nece... ail itself of ... formation and instruction from the E... uch broad ... Secretary of this Society By all means we ... ssary in ... continue our own radio talks and, so far ... ecutive ... possible, advise with our New Jersey State ... should ... stations to the end that the public may be ... as ... tected and no improper medical information ... radio ... seminated by irregulars, patent medicine co... pro... panies or improper cults

Shall we continue or arrest newspaper d... dis... semination of radio material?

The newspaper dissemination of radio talk... ... should be left to the discretion of the Executive ... Secretary, with the suggestion that only talks of ... outstanding importance and interest should be so ... disseminated

Will you indorse our recommendation of establishing a Public Relations Committee (under whatever name) for each county society, and urge such bodies to clean up newspaper advertising in their localities?

County societies, through their existing committees, should make every endeavor to advise with newspapers published in their respective counties to eliminate misleading and untruthful statements

Is it advisable to have a special committee to study Assembly Bill 290?

The study and steering of all legislation belongs to the Welfare Committee that has its own legal

(Continued on page 1295—adv xiii)

(*Continued from page* 1296—*adv xiv*)

of preventative medicine, public health, epidemics, etc., should be encouraged and given to the public through the press and over the radio and otherwise, subject to the following restrictive suggestions

"(a) That each unit Society appoint a publicity committee of three or more members whose duty it will be to read and pass judgment on an article before it is released

"(b) That the beginning of each article shall carry the fact that the Society is being represented by the essayist, and that any statements made are in accord with the best thought and judgment of the representative Society

"(c) That wherein the subject deals with therapy, and knowing that so very few doctors are in complete accord on this point, it is believed wiser to deal only in general terms and thus forestall definite pre-formed therapeutic opinions on the part of patients

"(d) That the common enemy 'quackery' can possibly be better narcotized by educating the public along conservative scientific lines rather than to attempt to char him through the more intense use of his tools"

FREE TONSIL CLINICS IN CLEVELAND

The August issue of the *Ohio State Medical Journal* has the following editorial on the free tonsil clinics promoted by the Cleveland Academy of Medicine

"In view of the extensive discussion concerning the purpose and conduct of various types of free clinics, both temporary and permanent, the recent action of the Academy of Medicine of Cleveland on this question is of general interest. The following comment in the July issue of *The Bulletin* of that Academy is significant and encompasses much in the brief paragraph

" 'There has never been any question about the desirability of providing service for the needy children of the county outside of the Community Fund area There was, however, an erroneous impression in connection with the early county tonsil clinics—namely that they were not a matter of charity but simply a public health program which tax-payers were privileged to use, if they wished This pauperizing influence is socially unsound and when so presented to the lay backers of the tonsil clinics was recognized as such The Academy office undertook to cooperate in the management of the clinics, to investigate the economic status of the applicants, consulting the family doctors when questions arose, and to supply volunteer operators selected by the chairman of the Otolarynological Section of the Academy, who worked in a regular and orderly fashion but without any compensation It is interest-

(*Continued from page 1295—xiii*)

"Choose first a man who is honorable, honest and conscientious He will afford you greater protection than the law Secondly one of good habits Thirdly one of sound judgment This is a wonderful asset to a physician

"Beware of the doctor who is not a member of his County Medical Society It is true that many poor ones belong, but few good ones do not Select, if possible, a man who is on the staff of a recognized hospital The directors of a hospital are in a better position to judge of his qualifications Regard with suspicion a doctor who objects to meeting others in consultation His ignorance is probably worthy of concealment

"Consider twice the doctor who demands payment in advance True, 'The laborer is worthy of his hire,' but a dollar is dearly earned that costs us the respect of others

"Everything considered, doctors are not very different from other commodities The cheapest is not always the best buy, and those who charge most sometimes sell inflated values

"Would that we might recall the old type of family physician, he who radiates sympathy and kindness Some doctors are so cold-blooded that they have to carry alcohol in their radiators to keep from freezing We need more of the spirit of humanity and less of the spiritus frumenti.

"With the best information available, the choice of a physician may, for many, prove something of a lottery, but if fortune does not favor you in the first draw, you can always call for a new deal

"Then go to him, on every birthday, for a health inventory Ask him to help you keep well"

MEDICAL PUBLICITY IN ARKANSAS

The annual report of the Committee on Publicity of the Arkansas Medical Society as recorded in the July *Journal* makes the following comments

"The most efficient avenues of reaching the laity, our actual and potential patients, are three personal contact and discussions, newspapers, and radio The abuse of any of these is not only culpable but intolerable The proper use of them, however, serves an excellent purpose wisely

"First We, your committee, are in favor of using these means of attaining the goal of an educational program, provided this privilege is kept on the high plane of composite good and not incriminated with individual and personal ambitions

"Second That articles of interest on questions

ing and gratifying that there was no dearth of volunteers on this basis Doctors are still willing to do proper charity The family doctors consulted were also very generous in their responses This method tends to make such physicians loyal to the Academy instead of antagonistic. Likewise the lay people in these outlying communities see the good intentions of the Academy All elements are cooperating and there is a minimum abuse of charity or pauperization Altogether it is an excellent practical example of professional direction of lay health movements, providing the best of service and preventing abuse' "

ANNUAL MEETING OF THE COLORADO STATE MEDICAL SOCIETY

The October issue of *Colorado Medicine* records editorially some snappy, outspoken impressions of the annual meeting of the Colorado State Medical Society, which was held in Greeley during the first week is September The editorial says

"Mr Paul M Clark emphasized the advantage of a Society liability defense plan, not so much to furnish simple legal defense in itself, as to cause physicians in general to avoid unguarded or careless criticism of their fellows, for under a defense plan such actions would be brought into the open in the course of investigation of the merits of a case It must be admitted that many times thoughtless remarks of a doctor are the beginning of a malpractice suit against his fellow

"The papers furnished by members were generally of a high character The courageous address of President Senger appears in this issue of *Colorado Medicine* The program was marred by a serious situation, and that was the switching of numbers from one hour to another, and even from one day to another, so that members who perhaps could attend only one day of the meeting or were on hand at the appointed time to hear and discuss a certain paper, were in some instances disappointed The Thursday afternoon session was so dragged out that a number of valuable papers were read before a scattered few hearers It is a grievous fault It is caused by two things, first a crowding of the program to begin with, and without any provisions for contingencies which invariably occur, and, second, a failure of those reading papers and discussions to abide by the time limit set by the by-laws of the Society

"The scientific exhibitors this year were few, but their exhibits deserve the compliments of the Society The *x*-ray exhibit especially was varied and large, and illumination much better than heretofore.

"It is believed that those who had the management of the meeting in their hands will agree that the work of the new executive secretary dem-

Vita* Glass *Effective* in Winter

St. Mary's Hospital, Grand Rapids is equipped with Vita glass

Tests show that sunlight coming through Vita glass windows in any season has high health value

Since the original installation of Vita glass in the first Boston Health Unit, two and a half years ago the Massachusetts Board of Health has authorized four additional installations. This is the Vita glass-equipped South Boston Health Unit.

FEBRUARY sunlight coming through Vita glass windows in New York contains sufficient ultra-violet rays in the vital range to make it effectively anti-rachitic. This fact has been proved definitely by the experiments which Walter H Eddy, Professor of Physiological Chemistry, Teachers College, Columbia University, has conducted for the past two years in that severest of winter months

"In 1929," writes Dr Eddy, "using a glass two years old†, we not only obtained protection between February 16th and March 16th, but we also proved that *three to four hours exposure was equivalent to a full 24-hour exposure in protective value*"

Dr Eddy concludes "I am convinced by these experiments that the installation of Vita glass windows in New York City insures the utilization of rays of real health value even in winter"

The Eddy experiments confirm anew the results gotten with winter sunlight and Vita glass by the council on Physical Therapy of the American Medical Association, and also the results reported in numerous other tests by scientific bodies and individuals In full agreement with them are the reports received from hospitals and sanitoria equipped with Vita glass throughout the United States

More than 250 institutions for the treatment of disease are wholly or partially equipped with Vita glass And from those in the latter class an impressive number of orders for repeat installations is being received

Available to you upon request is the authentic report of actual clinical results obtained with Vita glass, especially in the hospitalization of children, by Drs Caldwell and Dennett at Post Graduate Hospital, New York. This report formed an article published in the Journal of the American Medical Association for June 22, 1929 We shall be glad to send it to you on receipt of the coupon below

Vita glass Transmission Constant After Few Weeks Exposure

†The results of Dr Eddy's experiment with Vita glass two years old add new weight to the conclusions drawn from other biological tests, in which seasoned Vita glass similarly proved its retention of anti-rachitic and normal growth promoting properties

Accelerated weathering tests by the U S Bureau of Standards, Professor Stockbarger of the Massachusetts Institute of Technology, and many other individuals and groups have confirmed the power of seasoned Vita glass to transmit an effective amount of vital ultra-violet rays These tests have also shown that the solarization (weathering or seasoning) of Vita glass takes place very quickly, and that its transmissibility becomes constant after a few weeks of actual use

OFFICE WORK OF THE OREGON STATE MEDICAL SOCIETY

The August issue of *Northwest Medicine* contains the reports of the officers of the Oregon State Medical Society The Executive Secretary, Mr Clyde C Foley, reports on the office work of the Society as follows

"The taking of these new offices has enabled us to greatly expand our public educational work. A Public Health Information Bureau and Reading Room has been established in the front section of our new headquarters Here we have on display both in our store windows and the interior a complete stock of pamphlets, posters and other materials, dealing with all phases of health education. Materials are also available which warn the people against nostrums and quackery A stock of *Hygeia* and other high grade health magazines is also carried This bureau has attracted widespread interest among physicians, teachers, ministers, club secretaries and lay people generally, and several thousand pieces of literature have been distributed during the past few months. In connection with this educational work, the society office is also now acting as a sales agency for the books and journals published by the American Medical Association

"During the past few months, also, the Portland City and County Medical Society has established The Doctor's Official Credit Bureau for the purpose of compiling records as to how patients pay their doctors, and to collect delinquent accounts for its members This service will soon be placed upon a statewide basis and monthly reports of delinquent debtors will be furnished for each county in the state. This bureau should be of great benefit in reducing the large losses caused by rendering service to chronic debtdodgers

"Another cooperative plan which has been given a good deal of consideration is that of group purchasing of printing for our members It is likely that a definite plan will be worked out within the next few months which will result in saving our members substantial sums on the printing of their office forms and stationery"

AMERICAN PUBLIC HEALTH ASSOCIATION

The meeting of the American Public Health Association to be held in Minneapolis beginning September 30, is noticed in the following editorial in the September issue of *Minnesota Medicine*

"The meeting in Minneapolis, towards the close of the month, of a national society the size and importance of the American Public Health Association merits special editorial attention. The coincidental meetings of some nine other national, regional and state organizations whose concern is the public health, make the week of September 30 to October 5 a red letter week in the local calendar

"The majority of the medical profession are concerned with curative medicine as applied to the individual. Preventive Medicine as applied to social groups is in fact the more important and is demanding an increasingly larger share of the profession's time and personnel

"The coming convention will, it is true, be in large part devoted to the preventive phases of medicine, with emphasis placed on education, not only of physicians, nurses and workers in the various activities represented, but education of the public

'Here, at our door, comes the opportunity to acquaint ourselves as physicians with the scope of these various health associations and to broaden our field of knowledge of the specific health agencies, active in our state and country Health associations should be directed or advised by members of the profession and it behooves us to take advantage of this opportunity to become better acquainted with a number of them."

THE PRESIDENT'S PAGE

Several State Medical Journals make a featu of the President's Page, containing the messag which the President of the State Medical Socie wishes to convey to the members The *West Vi ginia Medical Journal* costains the following me sage from the President, Dr Harry M Hall

"'The music of the autumn wind sings low,
Down by the ruins of the painted hills,
Where death lies flaming with a marvelous glow
Upon the ash of rose and daffodils,
But I can find no melancholy here,
To see the naked rocks and thinning trees,
Each strips to grapple with the winter year
I see her gnarled hills plan for victories

I love the earth who goes to battle now,
To struggle with the winter whipping storm
And bring the glorious spring out from the night
I see earth's muscles bared, her battle brow,
And am not sad, but feel her marvelous charm
As splendidly she plunges in the fight.
Edwin Curran'

"This poet, without realizing it, sang of the medical profession as well as he did of the yellow leaf Each autumn we all go down to the sea of medical learning and accomplishment in the ships of what we have observed in the interval of summer Would there we all had the love of the grappling fight with ignorance and misunderstanding that the above lines assign to earth."

COST OF MEDICAL PRACTICE

Commenting on the annual address of President Harris of the American Medical Association, the July issue of the *Journal of the Tennessee State Medical Association* says

"It is perfectly evident that if medicine does not offer a solution lay people will There is ground for grave fear as to the effect a plan evolved entirely by a layman would have on medical service in general, the future of medicine as a science, and on the practice of medicine as an art and a science

"It does the profession no good to call attention to the fact that the budget of the moderately well-to-do family does not as a rule contain medical care as an expense to be met.

"It does no good for us to reiterate the well known fact that a large per cent of the average family income is pledged before it is earned

"We criticize and criticism is warranted, but criticism will not solve the problem We must recognize the problem and participate in its solution

"The situation seems to contain many inconsistencies This office has received more requests this year for information as to new locations in which a well qualified practitioner of medicine could earn a livelihood than in any like period of time with which the writer is familiar

ADENOMATA OF THE THYROID*

By HOWARD M CLUTE, M.D, F A C S
The Lahey Clinic Boston Mass.

THERE are three chief reasons why adenomata of the thyroid gland are of great clinical interest. They are part of a pathological process with which hyperthyroidism is often associated in later life, they are frequently the cause of marked tracheal deviation and narrowing, and, finally, in 90 per cent of all thyroid cancer, they are the precancerous lesion. The additional fact that many adenomatous goiters are very unsightly is a further reason for their removal, and in many cases is the consideration of most importance in the patient's mind

Clinically, the recognition of a thyroid adenoma lying in the neck is not difficult Typically, the lesion is irregularly placed so that the outline of the thyroid is asymmetrical and unusual differing from exophthalmic goiter in which the gland is diffusely and symmetrically enlarged On palpation the adenoma can be felt to be an encapsulated tumor resting in the thyroid gland It slips in and out of the fingers much like a golf ball in a pocket When more than one adenoma is present it frequently is possible with the fingers to differentiate numerous nodules from one another The size of the individual adenoma varies tremendously from a minute globule that is difficult to detect to a huge adenoma that is most unsightly

The origin of the thyroid adenomata has been the subject of much speculation and discussion Clinically there are two types of adenomata The first is the single or fetal type, which consists of an encapsulated portion of thyroid tissue showing various types of cell activity—hyperplasia, anaplasia, involution, degeneration, etc The second type and the more common one is the colloid adenoma These latter adenomata are almost always multiple and they are the basic lesion in the so-called endemic or adenomatous goiter More and more we are coming to the belief that these adenomatous changes in the thyroid result from the excessive repetition of the thyroid cycle of hyperplasia and involution over a long period of time in the absence of an adequate supply of iodine When this involution is extreme, degenerative changes occur in conjunction with it and nodules of thyroid tissue with varying degrees of activity make their appearance as the multiple adenomata of endemic goiter

It is quite generally believed that the single or "fetal" adenoma has a different origin than the multiple adenomata of endemic or adenomatous goiter The fetal adenoma is presumed to be more definitely a tumor of the thyroid gland arising from inter-acinar cell rests In a very definite percentage of patients with multiple adenomatous goiter, a fetal adenoma will be found in some portion of the gland There is no clinical measure, however, by which one can be certain of the presence or absence of a fetal adenoma in an adenomatous goiter and so it is desirable in this purely clinical discussion to consider together the so-called colloid adenomata and the fetal adenomata under the heading of *thyroid adenomata*

The presence of hyperthyroidism secondary to an adenomatous goiter is a very definite indication, in our opinion, for surgical removal of the adenomata Furthermore, we advise operation in many non-toxic adenomatous goiters because of the probability of later toxicity It has been our experience that 28 6% of the patients with adenomatous goiter whom we see are already showing evidence of thyroid intoxication

There is no question but that the dangers of thyroidectomy in adenomatous goiter increase as the age of the patient increases and as secondary hyperthyroidism arises In view of this fact and since there is practically no mortality associated with the early removal of non-toxic adenomata, we feel that operation should be more frequently undertaken before

WANTED SALARIED APPOINTMENTS EVERYWHERE for Class A Physicians Let us put you in touch with investigated candidates for your opening No charge to employers. Established 1896 AZNOE SERVICE is National, Superior AZNOE'S NATIONAL PHYSICIANS' EXCHANGE, 30 North Michigan, Chicago

WILL SHARE OFFICE—83rd and Park Ave Fully equipped with Fluoroscope and Diathermy Hours can be arranged Address Box 111 NEW YORK STATE JOURNAL OF MEDICINE

FOR SALE—Practice and nine-room house with office attached. Located in medical center of a growing central New York State manufacturing city of 35 000 Wonderful opening for eye ear, nose and throat specialist or general practitioner Present owner retiring on account of health. Address Box 211, NEW YORK STATE JOURNAL OF MEDICINE.

YOUNG LADY, evening college student, desires position in doctor's office as stenographer and receptionist. Previously employed in Manhattan State Hospital Reference available. Phone Mayflower 9002 or address Box 112, NEW YORK STATE JOURNAL OF MEDICINE.

PHYSICIAN will share or sublet office in modern new apartment building Beautiful rooms, very attractive layout, centrally located excellent accessability from every part of Greater New York. Communicate with H Thal 17 West 96th St. Riverside 8947

A NEW PRODUCT

Dr Upsher Smith and his sons are glad to be able to announce to all their physician friends the birth of a new product—Capsules Folia-Digitalis

Like the other members of the Digitalis family of Upsher Smith, this new product is produced at Foxglove Farm by the shores of Lake Minnetonka, where every single step right from the planting of the seed to the finished product is under the direct supervision of Dr Upsher Smith and his sons

It is here that careful work, rigid control, strict standardization are carried out, which have resulted in a Digitalis that is accepted by many authorities as the standard for comparison.

Each batch of Upsher Smith's Digitalis is standardized by the Hatcher Cat Unit Method and, for convenience of calculation, each preparation carries a dosage equivalent, thus

(Upsher Smith), ½ grain

Each capsule represents ½ cat unit, is equal to 5 minims of the Tincture Digitalis (Upsher Smith) and is 50% more potent than the average commercial leaf

The coupon brings you a prescription package with our compliments See page III —*Adv*

THE PEDIATRICIAN'S FORMULA

The first suggestion for the preparation of Mead's Dextri-Maltose came from pediatricians Naturally their preference for this particular form of carbohydrate is back of its very conception Dextri-Maltose brings mothers with their babies back to your office, not only because of its clinical results but because it satisfies the mother that her baby is receiving individual attention—that it is getting "a formula"

From your viewpoint, this mother-psychology is all the more an important point of medical economics because there are no feeding directions or descriptive circulars in the packages of Dextri-Maltose. It is truly the doctor's formula. See page XI —*Adv*

McGOVERN'S GYMNASIUM, INC

More and more physicians are realizing the futility of leaving patients to their own resources when exercises are prescribed, and have learned that through individual attention at McGovern's, their instructions will be faithfully carried out.

A work-out will convince you of the superiority of the McGovern Method Let us send you a guest card No obligations, of course. See page XII —*Adv*

IPRAL SQUIBB

Affects only the higher cerebral centers, therefore, gives refreshing sleep closely resembling the normal To the restless post-operative case, to the chronic insomniac, and even to the violently maniacal IPRAL SQUIBB brings the needed rest which may turn the tide in favor of the patient's recovery

Being quite soluble, Ipral is quickly absorbed and rapid in action

IPRAL SQUIBB is distributed in 1 oz. bottles and in 2 gr tablets in bottles of 10, 100 and 1,000 Write to the Professional Service Department for Literature. See page VIII —*Adv*

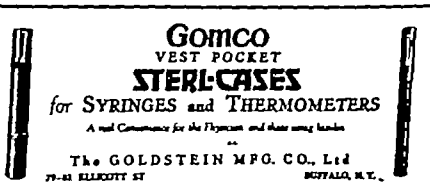
VITA GLASS

Vita glass has been subjected to numerous accelerated weathering tests by the U S Bureau of Standards, by Professor Stockbarger of the Massachusetts Institute of Technology, and by many other physicists These physical or quantitative tests, as well as biological experiments with rats and chickens, have established the fact that the solarization (weathering or seasoning) of Vita glass takes place quickly, and that after a few weeks' of actual use its transmission of ultra-violet light becomes constant.

Vita glass is being marketed primarily as a health prophylaxis and not as a therapeutic agent, although it is now serving in the latter capacity in numerous well authenticated instances—particularly in the solaria of more than 20 hospitals in England and the United States —See page XIX —*Adv*

LACTO-DEXTRIN

In an investigation of over 2,000 patients suffering from constipation and intestinal toxemia, the head of the Battle Creek Sanitarium laboratory found that the normal acid-forming bacteria could be restored in a satisfactory and efficient manner by the persistent use of Lacto-Dextrin (Lactose 73%—Dextrin 25%)



The extent of the change depends upon the amount taken, the length of time it has been given and the degree to which the intestine has been crippled by disease

By exclusion of putrescent foods and the continuous use of Lacto-Dextrin in smaller quantities, an aciduric flora may be maintained after it has once been established by Lacto-Dextrin feeding

In cases of obstinate constipation, quicker results may be obtained by the combined use of Lacto-Dextrin with Psylla (plantago psyllium)—a plant seed which provides bulk and lubrication. See page VII —*Adv*

THE SAHLER SANITARIUM, KINGSTON, N Y

Pleasantly located in the charming city of Kingston, within easy access of New York and with all the facilities for treatment usually offered by a modern sanitarium. Average price of rooms without bath, $35 00 a week, with bath $55 00 a week including ordinary medical and nursing attention. Organic and functional disorders of the nervous system and invalidism from any cause. No cases of insanity or of communicable diseases accepted. Booklet upon request. Raymond S Crispell, M.D, Medical Director Tel Kingston 948

X-Ray courses for Physicians—

nurses—technicians—X-Ray physics—technique—interpretation. Classes now forming Applicants may enter first of any month.

University of Buffalo School of Medicine

Requirements for admission Two years of college work, including twelve semester hours of chemistry, eight semester hours each of physics and biology, six semester hours of English, and a modern foreign language.

Laboratories fully equipped. Ample facilities for the personal study of cases.

Address SECRETARY, 24 HIGH STREET, BUFFALO, N Y

formerly had auricular fibrillation only in attacks may develop permanent auricular fibrillation In such cases as this, the patient becomes increasingly conscious of the heart

FIGURE 2

Goiter removed from patient in Figure 1 Note large portion of goiter lying below the clavicular impression in the mediastinum The part above the line is visible while that below the line is substernal

action and evidence of failing cardiac reserve becomes more marked Attacks of cardiac decompensation may occur and we find the patient having congestive heart failure with edema, orthopnea, liver enlargement and fibrillation After a period of rest in bed and other medical measures, the hyperthyroidism is perhaps less severe, the heart action becomes less rapid, evidence of congestive heart failure disappears, and the patient once again gets up and goes about his business Following some unusual strain or infection, another attack of congestive heart failure is brought on and again the patient returns to bed for rest and medical treatment. The case rapidly assumes all the characteristics of chronic cardiac disease and any evidences of hyperthyroidism are either relegated to a secondary position or completely overlooked

If a basal metabolic rate were done in a patient of this type during the period in which congestive failure was absent, the rate would be elevated and many evidences of hyperthyroidism which the congestive failure had obscured would be more obvious Such patients are typically emaciated Furthermore, the history gives evidence of marked variation in weight over a period of years Such patients are pigmented with a peculiar yellowish brown color of the skin Such patients have marked muscle weakness and inability to carry out the work which they ordinarily would perform, though they repeatedly try to do it. In the more severe cases, the patient is bed-ridden most of the time Certainly from our experience, any examination of a patient with attacks of irregular heart action or congestive failure

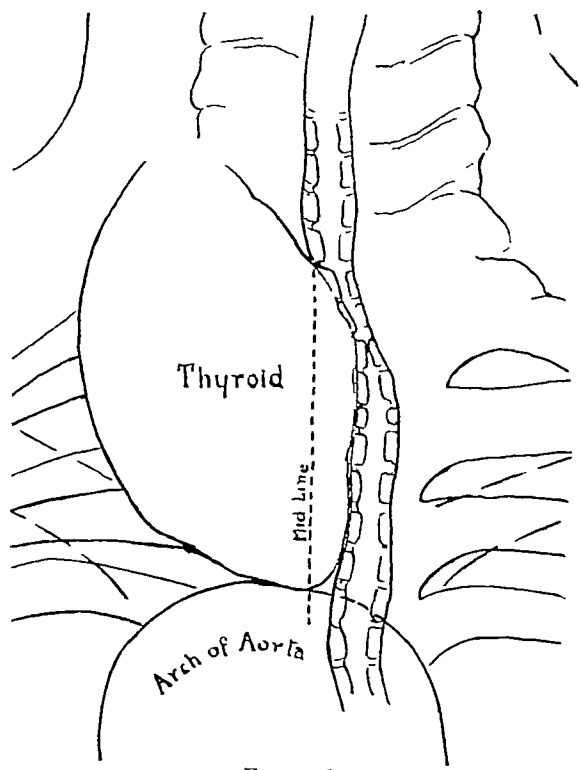

FIGURE 3

Diagrammatic tracing of an X-ray of a patient with a substernal goiter Note the rotation angulation and marked narrowing of the trachea caused by the large substernal thyroid adenoma

or both should include a thorough thyroid gland examination Furthermore, if a patient has an adenomatous goiter and attacks of heart failure, we would, in most cases, strongly consider the removal of the goiter, even though there was no complete clinical proof that the goiter caused the heart attack

the patient has grown old and before toxicity has developed

For some years we were of the opinion that it was unwise to prepare toxic adenomatous goiter patients for operation with Lugol's Solution In other words, we at first inclined to the belief that the hyperthyroidism of exophthalmic goiter differed in some way from hyperthyroidism accompanied by thyroid adenomata We are now more and more impressed that hyperthyroidism is much the same in each type of patient and should be similarly treated We therefore prepare our patients who have adenomatous goiter and secondary hyperthyroidism for operation in the same way that we prepare our patients with exophthalmic goiter by giving them Lugol's solution rest in bed and extra food and fluid Patients with toxic adenomata have been definitely improved with this regime and their operability has been increased

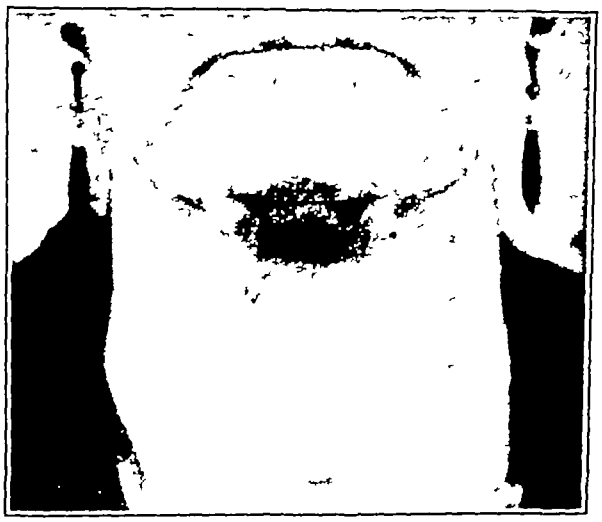

FIGURE 1

Multiple adenomata of the thyroid with a substernal extension little to be expected from the appearance of the neck

Hyperthyroidism in an adenomatous goiter is occasionally of such severity that operation is only to be considered after unusually long and careful preparation and in rare instances can never be undertaken These are, of course, the extreme cases resulting from long continued thyroid intoxication who have already passed middle life and may well be considered as "neglected cases" Patients with secondary hyperthyroidism of this kind formerly were operated upon with a mortality rate ranging from 3 per cent to 8 per cent Today, however, iodine medication, rest in bed, and carefully graded surgery have united to lower this mortality very materially In the Lahey Clinic in 1928 1,068 goiter cases were operated upon, 536 of these were exophthalmic goiter cases and none died 82 patients with toxic adenomatous goiter were operated upon and one died, a mortality rate of 1 22 per cent The mortality rate for all kinds of hyperthyroidism in 1928 was therefore 16%

Undoubtedly the group of patients who are old, emaciated, enfeebled and almost completely crippled by long standing hyperthyroidism in an adenomatous goiter can be readily diagnosed by every clinician They usually impress one as being "all goiter," and the relationship between their illness and their thyroid gland is quite obvious It is very satisfactory to realize that today, however, they can be safely carried through a thyroidectomy which will in almost every case produce most remarkable improvement This group of cases now need to be taught earlier in their course that they should not fear surgery, but that they should fear the disease from which they suffer

We would like particularly to emphasize the importance of discovering adenomatous goiters when present in individuals who present symptoms primarily related to their heart action—members of the group whom we term "thyrocardiacs" There are, of course, various degrees of heart involvement that occur in association with adenomatous goiter The mildest type of heart disturbance that we see in this association is the patient who has occasional attacks of auricular fibrillation Not infrequently a man of middle life who has never had any history of previous infection that might have caused a damaged heart develops attacks of irregular heart action As a rule these attacks come on after some unusual exertion or excitement or follow some infection Between the attacks, heart action is normal and there is no evidence of any organic disease Examination of the thyroid reveals the presence of one or more adenomata In many of these patients, on careful questioning, a history of mild thyroidism can be elicited and clinically this can usually be confirmed as the basal metabolic rate is elevated in most cases At times it may be within normal limits but this does not preclude the existence of a slight degree of thyroidism, a fact which is becoming more and more recognized We have repeatedly seen the removal of an adenomatous goiter in this type of patient result in a complete cessation of the attacks of disorderly heart action It is most important therefore that any patient developing attacks of auricular fibrillation should have a most careful thyroid examination and that the removal of any goiter in such a case be strongly urged

In any thyrocardiac as the hyperthyroidism progresses, evidence of heart involvement becomes more pronounced The patient who

respiratory difficulty arise from sudden hemorrhage into a thyroid adenoma In these cases there has been rapidly increasing difficulty in breathing so that marked stridor develops within a few hours There may be considerable difficulty in swallowing when the hemorrhage is large enough to cause distortion of the pharynx and produce marked pressure upon it Although respiratory obstruction from hemorrhage into a thyroid adenoma is rare, we have, however, seen several such cases and it is a condition which may occur at any time in any adenoma.

It is an accident startling to both patient and physician, and in some instances it is an accident which requires emergency surgical measures to relieve the respiratory embarrassment This is particularly true if the adenoma in which the hemorrhage occurs is substernal, since sudden, marked increase of a substernal tumor can scarcely occur without producing evidence of pressure. Such a hemorrhage into an adenoma is indication for immediate removal of the goiter

It is our feeling in the Clinic that malignancy of the thyroid gland occurs more frequently and is of more significance than the profession at large would seem to realize It is true throughout the various thyroid clinics in the United States that thyroid malignancy occurs in approximately two per cent of all the patients with thyroid disease that are seen If one could omit from the statistics the patients with exophthalmic goiter, colloid goiter and various types of thyroiditis in which malignancy does not usually occur, and include only patients with adenomatous goiter, which almost always precedes cancer the instance of malignancy would be more striking In the Lahey Clinic we have operated upon 2,787 cases of adenomatous goiter, and we have operated upon 125 cases of thyroid malignancy—an incidence of 4 5 per cent of malignancy in adenomatous goiter

It is generally accepted that 90 per cent of all thyroid malignancy arises in a pre-existing adenoma and that the adenoma is the premalignant lesion in the thyroid gland. It is by no means generally urged however by physicians throughout the country that such a premalignant lesion should be removed

In the patients who have frankly malignant thyroid tumors which can be diagnosed clinically, the outlook for recovery is extremely poor In a recent study of thyroid cancer in the Clinic, we found that we were able to diagnose malignancy in 45 patients when they were first examined Of these, 35 are now dead, or have a recurrence of the growth, 4 were not traced, 3 have gone but a short time since their operation, and should not be considered This leaves in 45 cases that were diagnosed clinically as malignant thyroid disease on their first examination only three who are known to be alive and well for more than five years Obviously, then, if we wait until we can diagnose malignancy of the thyroid by clinical examination, we can offer the patient little or no hope of recovery

The symptoms of thyroid malignancy as they are given in the text books are the symptoms of hopeless thyroid malignancy Hoarseness, difficulty in breathing, rapid growth of tumor, and firm, hard fixation of the tumor in the neck are all symptoms and findings in the advanced and hopeless case of thyroid cancer In our experience there are no symptoms of thyroid malignancy which occur sufficiently early in its course

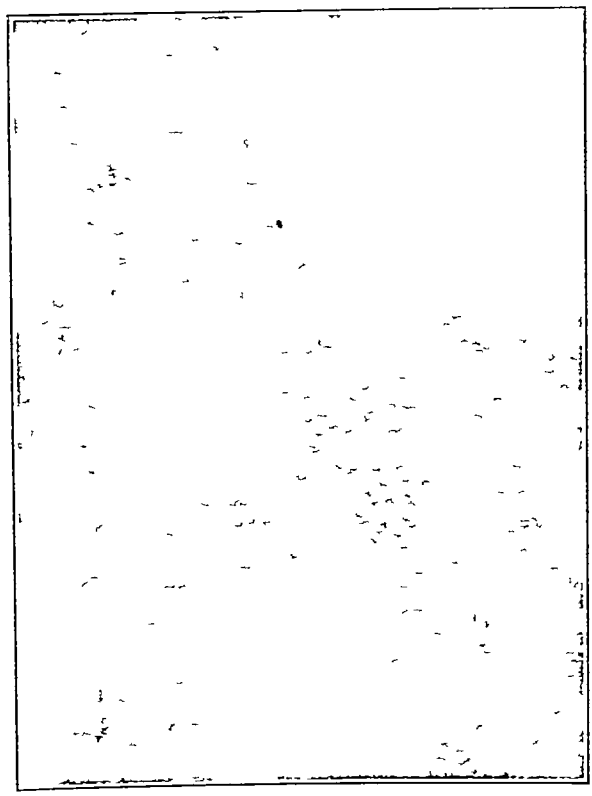

FIGURE 5

Lateral view of the trachea in same patient as in Figure 4 Note the trachea curving forward from the posterior pressure of an encircling retro-tracheal substernal goiter

to permit one to wait for them before advising surgery because of malignancy

We commonly see patients with an adenoma of the thyroid gland who have been told, with the best intentions in the world, that they need do nothing about it until it begins to cause "trouble" If this "trouble" chances to be sudden growth due to malignant degeneration of the adenoma, the best chance of curing it by surgical removal is lost and their delay becomes tragic

Another group of patients whom we see with thyroid adenomata have had basal metabolism tests taken which were found to be normal They

The adenomatous goiter in many cases causes pressure symptoms In the majority of patients these evidences of tracheal and esophageal pressure arise very slowly over a period of years In our experience, interference with swallowing has been quite rare and has been limited to cases of malignancy and to those non-malignant cases in which the thyroid enlargement was rapid in origin Difficulty in breathing, however, with stridor and dyspnoea due to the pressure of the thyroid gland upon the trachea with resulting distortion and narrowing is very common in

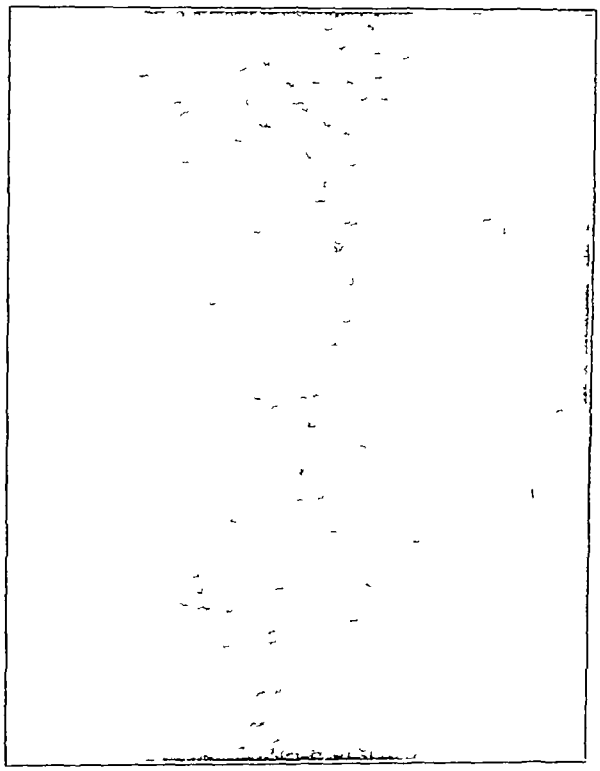

FIGURE 4

X-ray of the trachea in a partly substernal adenomatous goiter Note the marked deviation of the trachea away from the midline

adenomatous goiter It is probable that the trachea, being a semi-rigid structure, cannot deviate from its normal position without having its lumen affected, while the esophagus, on the other hand, being a pliable muscular tube, can readily vary from its usual position without causing symptoms Tracheal pressure and partial obstruction may arise from an adenomatous goiter which is entirely in the neck or partly or wholly below the superior thoracic strait

X-rays of the trachea and larynx in long-standing adenomatous goiter reveal valuable information and explain in many instances the respiratory difficulties of which the patient complains In cases of suspected substernal goiter *x*-rays of the superior mediastinum and of the neck should be taken with a view to demonstrating the trachea In order to show this structure more clearly, the pictures are best taken when the patient has filled his bronchi and trachea with air and views should be taken in both the antero-posterior and the lateral positions Only with lateral views of the trachea does one obtain evidence that the goiter has gone behind the trachea and is of the encircling type If the adenomata in the goiter have degenerated to any marked degree and are of sufficiently long standing, calcification may occur and this calcification will, of course, show in varying degrees the outline of the goiter

Clinical examination of the larynx and trachea will also reveal very marked evidence of tracheal deviation in certain adenomatous goiters and will call attention to the need of *x*-rays in the case Normally, when the chin is in the midline of the body, a line drawn through the middle of the chin and the middle of the suprasternal notch should pass through the notch in the thyroid cartilage Any marked pressure on the thyroid cartilage by a goiter will cause rotation of the cartilage and deviation of this notch from the midline In many instances the course of the trachea can be palpated between the cricoid cartilage and the sternal notch, and any deviation from the midline noted With adenomatous goiter it is not infrequently found that the trachea lies well away from the midline on one side of the center of the neck When the goiter descends behind the sternum into the superior mediastinum it pushes the trachea away from its usual central position Marked tracheal deviation, therefore, beneath the sternum, is direct evidence that there is a substernal extension of the goiter The substernal goiter is also suspected when careful palpation of the thyroid gland by the method of dislocating each lobe, which Dr Lahey has described, is followed If one is unable to feel the lower pole of either thyroid lobe, then it is most probable that there is a substernal extension of the goiter

Occasionally patients are seen who have completely substernal goiter with no evidence of a thyroid enlargement in their neck Here we are dependent upon *x*-rays of the trachea to demonstrate this goiter by showing the deviation of the trachea beneath the sternum from the midline Occasionally in such a case the patient can bring the upper part of the thyroid gland into view by severe straining or coughing, and the goiter will be seen to bulge upward into the root of the neck but often in substernal goiter no evidence of it can be seen and it will be found only by routine *x*-rays of every suspicious case

In certain rare instances we have seen acute

within the county, six were wholly or partly represented in this survey In addition to Saranac Lake, one other village, Elizabethtown, did not appear in our returns Of the eighteen towns eleven were represented in whole or in part

According to our best estimates, the population in that section of the county from which we secured reports was somewhat in excess of eighteen thousand, the number of persons for each reporting physician averaging, therefore, about nine hundred The corresponding ratio for the entire State, exclusive of New York City, was 841 Since the relative number of physicians in rural districts is less than in cities, our estimate of population appears quite reasonable

The Sickness Report Form—The report form used in the survey (Fig 1) was, of course, far from perfect We were guided in its preparation by two basic considerations—brevity and simplicity The list of causes had to be brief, since we could not ask a busy rural practitioner to give the time that would be necessary to fill out a blank containing all of even the more important types of sickness For the same reason we limited the subdivisions to sex only, making no provision for age, occupation, and other facts relating to the personal history of the patient or for the duration and degree of severity of the illness One proposed, and very desirable heading, "all other types of diseases," which would have given us a picture of the entire morbidity situation, had to be omitted because some of the physicians preferred not to disclose the general extent of their practice

Survey of Morbidity in ESSEX COUNTY

SICKNESS REPORT: Week ending 192

The number of NEW CASES attended by me during the week ending Saturday midnight was as follows

Disease	Males	Females
Appendicitis		
Arteriosclerosis		
Cancer		
Children, diseases of*		
Colds		
Diabetes		
Diarrhea and enteritis (—2 yrs.)		
Digestive disorders, other		
Gonorrhea		
Gynecological cases		
a. Operative		
b. Non-operative		
Heart disease		
a. Rheumatic		
b. Syphilitic		
c. Other forms		
Nervous disorders		
a. Functional		
b. Organic		
Nephritis, acute		
Nephritis, chronic (Bright's disease)		
Rheumatism		
a. Acute rheumatic fever		
b. Chronic arthritis		
Skin disease		
a. Contagious		
b. Non-contagious		
Surgical (except gynecological)		
Syphilis		
a. Acquired		
b. Congenital		
Tonsilitis		

*Outside of reportable and those listed on this card.

FIG. 1
Report form used in survey

Since Essex County, because of its numerous summer and health resorts, has a large transient population, the physicians were asked to report cases of sickness among *residents* of the county only They were also asked to report *new cases*, as well as new patients In other words, if John Smith called on a physician and the latter diagnosed his condition as an ordinary cold, he entered on the card, in the column of males, one case of cold If a few weeks later the physician found that the same John Smith suffered an attack of appendicitis, he entered on the card one case of appendicitis The several explicit rubrics were to include all types of disease outlined under the corresponding heads in the International List of Causes of Death Thus, "cancer" was to comprise Nos 43-49 of the International List, "diseases of the heart," Nos 87-90, and so on The term "children" related to persons under 16 years of age. Explanation of the other multifarious titles together with certain suggestions, was given on the reverse of the card (Fig 2) The physicians were furnished stamped and addressed envelopes in which to mail the cards to the Division of Vital Statistics each week

Our list included gonorrhea and syphilis because at the time of the survey cases of these diseases were reportable by laboratories and not directly by physicians In addition to the types of sickness shown on the report form, we also tabulated the cases of sickness reported by the participating physicians to the Division of Communicable Diseases Whenever a report contained an ambiguous or contradictory entry, or if a physician was in doubt about reporting or not reporting a case in his practice, the necessary adjustments were made, either by correspondence or through Dr Munson's assistance

General Results—A summary of our results is presented in Table 1 The cases of sickness totalled 19,179 It is possible that this figure contains a number of repetitions—in other words, that some patients were treated for the same con-

also are told, with the best of intentions, that they need do nothing about the adenoma, since it is not causing hyperthyroidism This advice, in our opinion, fails to place sufficient stress on the fact that the adenoma is a pre-malignant lesion, and that the presence or absence of toxicity is really of secondary importance when the question of removal is being considered

It is our belief that cancer of the thyroid gland is best attacked by the early removal of all thyroid adenomata since there is no clinical method for distinguishing innocuous adenomata from their fellows

The thyroid adenoma, then, either of the single fetal variety or the multiple colloid type, is a dangerous lesion and should arouse sharp clinical interest when it is discovered Once adenomata are present in the thyroid, no good can arise from them, if anything happens, it will be for the worse They are so frequently the cause of toxicity, of tracheal pressure, and of malignancy, and they are so often unsightly, that their presence usually is sufficient evidence for their removal

---

SICKNESS IN ESSEX COUNTY

Survey of Morbidity During the Fifty-Two Weeks—Oct. 2, 1927—Sept. 29, 1928

BY J V DE PORTE, PH D
From the Division of Vital Statistics New York State Department of Health

THE prime function of public health work is the protection of society against sickness and death, the individual, as such, receiving consideration insofar as he represents a unit in a social group From the orthodox medical point of view, the ill-health of an individual is a matter of concern to public health if, and only if, it is likely to affect the health of others This position fostered the erection of a rather artificial barrier between the so-called communicable and non-communicable diseases—the sphere of public health activities being defined within the former group, with the non-communicable diseases left to the untrammelled enterprise of private practitioners

While it is true that for practical reasons official public health agencies at present cannot cross the line separating the communicable from the non-communicable diseases, the points of infiltration from one group to the other are so numerous that no satisfactory view of the communicable field as a whole can be developed without a consideration of all forms of human illness Instances in which communicable diseases appear as complications of so-called non-communicable diseases, and vice versa, are only too common and in theoretical studies, at least, the line of demarcation must be disregarded

Since cases of communicable diseases are reportable, we have fairly accurate knowledge regarding the prevalence of the various types listed in State and City sanitary codes Information about non-communicable diseases is, however, very fragmentary and yet there is, unquestionably, a place in that field for qualitative analyses of group experiences

It is with this point in mind that, in 1927, the New York State Department of Health made a survey of morbidity from important types of non-communicable diseases in certain districts of rural New York scattered throughout thirty-three counties * In referring to this survey in the following pages we shall use, for the sake of brevity, the term "Rural Survey" When this survey was well under way, it occurred to us to attempt to make a more intensive study of one county Essex was selected for that purpose and with the active aid of Dr William L Munson, District State Health Officer, the project was brought to the attention of all physicians practicing in that county, outside of Saranac Lake That village was omitted because the larger portion of it lies in another county—Franklin All of the physicians readily consented to report each week, on forms provided by the Department, the occurrence in their practice of certain specified types of non communicable diseases The survey commenced on October 2, 1927, and continued for fifty-two weeks In the course of the year several of the physicians were obliged to discontinue their reports Our original aim of securing a complete picture of the prevalence of certain diseases in an entire county was, therefore, not accomplished The partial results, however, representing a major fraction of the total volume of sickness in the county, are of sufficient interest to warrant their publication

Area and Population—Essex County lies in the northeastern part of the State, embracing the major portion of the Adirondack Mountain region It comprises a territory of 1,836 square miles and had, at the time of the State Enumeration of 1925, a population of 32,042 It is, with the single exception of St Lawrence, the largest county in the State, and, again with but one exception, Hamilton County, it is the most sparsely populated, with 17 5 persons per square mile. Essex is almost wholly rural, its incorporated villages (there are no cities within the limits of the county) ranging from 422 in Bloomingdale to 3,858 in Ticonderoga Of the eight villages

*J V DePorte, Sickness in Rural New York" *Journal of the American Medical Association* Feb 16, 1929 Vol 92, pp 522 528

TABLE I

CASES OF ALL REPORTABLE AND NON-REPORTABLE DISEASES, BY SEX

CAUSE OF SICKNESS	TOTAL		MALE		FEMALE	
	Number	Per Cent	Number	Per Cent	Number	Per Cent
Total	19,179	100 0	9,492	100 0	9,687	100 0
Non-reportable diseases	18,867	98 4	9,333	98 3	9,534	98 4
Reportable communicable diseases	312	1 6	159	1 7	153	1 6

The leading cause was colds, with a total of over five thousand cases, or 26 8 per cent of all cases of non-reportable diseases Surgical cases (except gynecological) were responsible for 21 0 per cent, followed by cases of digestive disorders with 12 2 per cent. Thus, 60 per cent of all causes of sickness were listed under these three heads Of the 1,055 cases of nervous disorders, one-seventh were given as organic, the rest being functional. Cases of diseases of the skin totalled 851, one-third of them being contagious and the rest non-contagious Three subdivisions were shown under the general heading diseases of the heart—rheumatic, syphilitic, and other forms Of the total 535 cases, 121 were indicated as rheumatic and 9 syphilitic the bulk, 405, being shown under the heading "other forms" Reported cases of syphilis totalled 30, of which 2 were congenital and the rest "acquired"

The proportion which the various types of sickness formed of the number of cases among males and females was, in most cases, dissimilar The differences were especially marked under surgical cases, which represented 28 3 per cent

TABLE II

CASES AND PERCENTAGE DISTRIBUTION OF NON-REPORTABLE DISEASES, BY SEX

CAUSE OF SICKNESS	TOTAL		MALE		FEMALE	
	Number	Per Cent	Number	Per Cent	Number	Per Cent
All non-reportable diseases	18,867	100 0	9,333	100 0	9,534	100 0
Colds	5,051	26 8	2,577	27 6	2,474	25 9
Surgical cases—operative, traumatic (except gynecological)	3,953	21 0	2,641	28 3	1,312	13 8
Digestive disorders (other than diarrhea and enteritis, under 2 years)	2,304	12 2	1,008	10 8	1,296	13 6
Diseases of children (except communicable and those listed in this table)	1,081	5 7	557	6 0	524	5 5
Nervous disorders	1,055	5 6	288	3 1	767	8 0
Functional	901	4 8	231	2 5	670	7 0
Organic	154	8	57	6	97	1 0

SUGGESTIONS FOR REPORTING

In using the form on the reverse side of this card, please follow the directions carefully

Enter a mark for each *new* case, thus

Disease	Males	Females
Tons litis	///	////

And as further new cases are seen, simply add to the check ma ks thus

	////	///

The value of this record lies in its completeness, it is therefore important to send in the card weekly, even when NO new cases of the specified diseases are seen.

Under Colds" enter bronchitis, coryza, "grippe", laryngitis, pharyngitis and similar conditions

Under Children, diseases of" enter all forms that are at present not reportable or shown elsewhere on the card, for instance rickets, pyelitis, malnutrition, etc.

Under "Surgical' enter operations for any cause, injuries due to accidents, etc.

9-22-27-2000 (19-2079)

FIG 2

Reverse of report form used in survey

dition by more than one physician. The practice of changing physicians is, however, not common in rural territory and the element of error introduced by it is probably inconsiderable The recorded cases equalled, roughly, our estimated population, the cases, therefore, averaged one for each person annually This figure agrees with the result secured in the Rural Survey

Cases of communicable diseases which are reportable under the provisions of the New York State Sanitary Code numbered 312, or 16 per cent of the total cases of all types This percentage is considerably lower than that shown in the Rural Survey (33) At this point we may note that the list of diseases in the report form used in Essex County included one title, "diseases of the skin," which was not shown in the form used in the earlier survey, but even if the cases reported under this head are subtracted, the communicable diseases represent only 17 per cent of the reduced total

The number of cases of sickness reported among women was slightly higher than among men If, however, the gynecological cases were deducted, the total of cases among men would be greater than among women But here we must consider another group—surgical cases—which numbered 2,641 among men, more than double the corresponding figure for women, 1,312 While this disparity is, of course, without direct physiological basis, yet, in a sense, it is a result of sex differences Even in these days of equal rights men are exposed to greater hazard of physical accident, the lives of women still being, if we may be allowed to use a mid-Victorian term, more or less sheltered We shall, therefore, not attempt to interpret in any way the indicated distribution of cases according to sex

Figure 3 shows the relative prevalence of the reportable communicable diseases as compared with the specified types of the non-reportable diseases Here we may observe that cases of ten groups of the non-reportable diseases were more prevalent than the sum of all reportable communicable diseases

Non-Reportable Diseases—Table 2 shows in detail the distribution of the non-reportable diseases

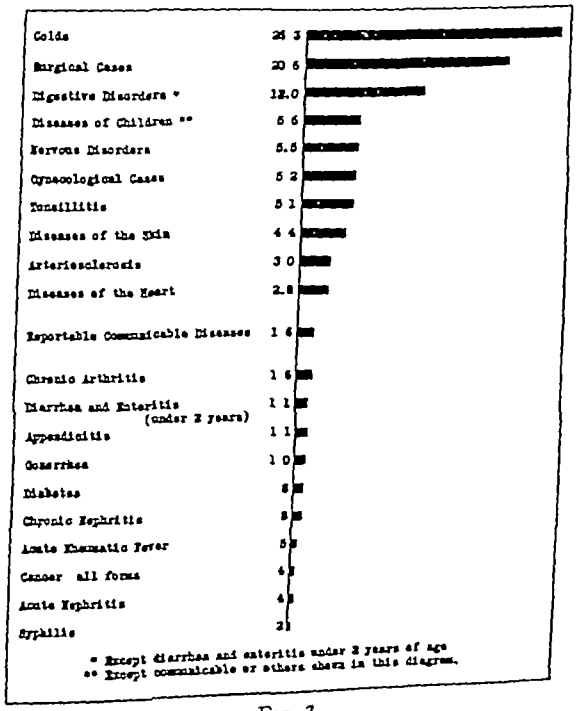

FIG 3

Percentage distribution of all cases of sickness

TABLE IV

PERCENTAGE DISTRIBUTION OF CASES OF NON-REPORTABLE AND OF ALL REPORTABLE COMMUNICABLE DISEASES, BY QUARTERS OF THE YEAR

CAUSE OF SICKNESS	FIRST QUARTER (January 1–Mar 31, 1928)	SECOND QUARTER (April 1–June 30, 1928)	THIRD QUARTER (July 1–Sept. 29, 1928)	FOURTH QUARTER (October 2–Dec 31, 1927)
All non reportable diseases	26 7	25 3	23 3	24 7

Congenital	50 0		50 0	
All reportable communicable diseases	35 6	25 6	15 4	23 4

cases of tonsillitis was reported in March, with the minimum in September The maximum number of cases of diarrhea was reported in October with an almost equal number in June, the minimum in March and April The seasonal variation in cases of the remaining non-reportable diseases was definitely less than in cases of reportable communicable diseases, as can be readily seen by reference to the diagram The maximum in the former group occurred in August, the minimum being recorded in April Reportable diseases had a peak in February, with a minimum in September

Table 4 shows the percentage distribution of sickness by quarters of the year

The greatest amount of sickness, 26 7 per cent, occurred during the three winter months and the least, 23 3 per cent, during the third quarter of the year

The peak of cases of non-reportable diseases was recorded during the first quarter, almost entirely because of the greater prevalence of colds Among the individual cases we note that almost one-third of the cases of colds were recorded during the first quarter, while during the third quarter these cases were only 17 per cent of the total for the year The distribution of cases of tonsillitis was similar to that of colds, although the peak was not accentuated to the same degree, the maximum, during the second quarter, represented 28 per cent and the minimum, during the third quarter, 18 per cent of all cases Of the outstanding differences in the distribution of the other large groups of causes by quarters of the year, the following may be mentioned in the group of surgical cases the peak, 31 per cent, was recorded during the third quarter, the minimum, 22 per cent, during the last quarter of the year Digestive disorders had a peak, 29 per cent, in the third quarter and a minimum, 23 per cent, in the fourth quarter

Comparison with Results of Rural Survey— The outstanding points of difference between the results secured in the Essex County Survey and the more extensive Rural Survey are as follows

The group of reportable communicable dis-

TABLE III

CASES AND PERCENTAGE DISTRIBUTION OF REPORTABLE COMMUNICABLE DISEASES, BY SEX

Epidemic encephalitis	1	3			1	7
Epidemic or streptococcus (septic) sore throat	1	3			1	7
Vincent's angina	1	3	1	6		

of all cases among males and less than half that proportion, 13 8 per cent, among females Cases of digestive disorders were more prevalent among women—13 6 per cent as compared with 10 8 per cent among men, and the proportion of cases of nervous disorders was more than double the corresponding figure among men—8 0 per cent and 3 1 per cent respectively Among women, one-tenth of the total of sickness was under the head gynecological In 130, out of the 1,001 cases reported, operative treatment was needed, the remaining cases being given as non-operative

The number of cases of gonorrhea among men (165) was six times that among women (28), the corresponding percentages being 1 8 and 0 3 In considering these figures it must be remembered, however, that many cases of gonorrhea among women were undoubtedly listed under the head of gynecological conditions

Reportable Diseases—Table 3 lists the communicable diseases reported by the cooperating physicians

The leading disease was scarlet fever, with 35 6 per cent of all cases, followed by mumps, 18 3 per cent, and pneumonia, 14 4 per cent If to this list are added syphilis and gonorrhea, which were not reportable, it is found that gonorrhea was the most prevalent communicable disease in the section of the county represented in our survey—the total of cases exceeding by more than 70 per cent that reported for scarlet fever Syphilis falls in sixth place, taking precedence over tuberculosis

There was a variation in the proportions of cases reported according to sex, the numbers, however, are too small to warant any deduction

Seasonal Distribution of Morbidity—The prevalence of the several types of illness varied from month to month, but in the case of the non-reportable diseases, with the exception of colds, tonsillitis, and diarrhea and enteritis (under 2 years), the variation had no particular seasonal significance

Figure 4 shows the distribution, by months, of reported cases of the three types of illness mentioned above as well as all the other non-reportable diseases combined and of the group of reportable communicable diseases Colds had a peak during May and a secondary, almost equally high, peak in February, while the minimum number of cases was reported in July The peak of

cases of tonsillitis was reported in March, with the minimum in September The maximum number of cases of diarrhea was reported in October with an almost equal number in June, the minimum in March and April The seasonal variation in cases of the remaining non-reportable diseases was definitely less than in cases of reportable communicable diseases, as can be readily seen by reference to the diagram The maximum in the former group occurred in August, the minimum being recorded in April Reportable diseases had a peak in February, with a minimum in September

Table 4 shows the percentage distribution of sickness by quarters of the year

The greatest amount of sickness, 26 7 per cent, occurred during the three winter months and the least, 23 3 per cent, during the third quarter of the year

The peak of cases of non-reportable diseases was recorded during the first quarter, almost entirely because of the greater prevalence of colds Among the individual cases we note that almost one-third of the cases of colds were recorded during the first quarter, while during the third quarter these cases were only 17 per cent of the total for the year The distribution of cases of tonsillitis was similar to that of colds, although the peak was not accentuated to the same degree, the maximum, during the second quarter, represented 28 per cent and the minimum, during the third quarter, 18 per cent of all cases Of the outstanding differences in the distribution of the other large groups of causes by quarters of the year, the following may be mentioned in the group of surgical cases the peak, 31 per cent, was recorded during the third quarter, the minimum, 22 per cent, during the last quarter of the year Digestive disorders had a peak, 29 per cent, in the third quarter and a minimum, 23 per cent, in the fourth quarter

Comparison with Results of Rural Survey— The outstanding points of difference between the results secured in the Essex County Survey and the more extensive Rural Survey are as follows

The group of reportable communicable dis-

eases represented only 1 6 per cent of all cases of sickness in Essex County as compared with 3 3 per cent in the Rural Survey This point, however, is of no special significance since the totals in the Essex County Survey are comparatively small If this survey were made in a year of greater prevalence of one or another of the communicable diseases, it is likely that the percentage represented by the group of reportable diseases would be as high as that reported in the Rural Survey

Comparing the percentages represented by certain important groups of non-reportable diseases (exclusive of diseases of the skin), we note that the proportions of colds in the two surveys were practically identical, surgical cases were relatively more numerous in Essex, while digestive disorders, diseases of children, nervous disorders, arteriosclerosis, diseases of the heart, and rheumatism were less prevalent than in the Rural Survey

There were few outstanding differences in the distribution of reported cases by sex In Essex, more cases of diseases of the heart were reported among males, in the Rural Survey, among females Among the other causes of sickness the proportions for the two sexes did not differ materially

When the reported cases are grouped by seasons, we find that the range between the high and the low points was less in Essex than in the Rural Survey under the following heads colds, surgical cases, diarrhea and enteritis (under 2 years), the group of all reportable communicable diseases, and greater for digestive disorders, neuroses, rheumatism

In general, the points of similarity between the results secured in the two surveys were much more numerous than the points of difference This is one element of value in the Essex County Survey since it gives support to the more important facts brought out in the Rural Survey

Conclusion

The figures given in this paper are but a modest addition to our quantitative knowledge of the prevalence of certain types of non-communicable diseases, but in the absence of a systematic collection of facts in this field the presentation of even a small increment seems justifiable

The two surveys directed by the State Department of Health were made possible through the *voluntary* cooperation of one hundred and twenty-seven busy practicing physicians This fact, in my opinion, is of transcending significance. The spirit of altruistic scientific inquiry manifested by these physicians encourages a hope of further investigations which could not be carried out in laboratories or offices of official and private health agencies

It is a pleasure to express the appreciation and thanks of the Department, as well as my own, to the following physicians who collaborated in the Essex County Survey

CHILD WELFARE SURVEY OF SARATOGA COUNTY*

By J R. MACELROY, M D, JONESVILLE, N Y

DURING the World War it was brought most forcibly to our attention that a large per cent of those found physically unfit for military service might have escaped permanent disability had their defects been recognized and treated in early life In spite of the wide publicity given this no really concerted activity has arisen to prevent a continuance of these defective conditions among the children of today

Lay Organizations all over our fair land, assisted by the Profession, have and are maintaining a constant warfare against Tuberculosis, especially among the young, but it seems that once a child has been labelled Tubercular, no matter how incipient, all other defects the same child may have, pale into insignificance. So long as philanthropists continue to pour millions into the coffers of these Organizations we may rest assured that the paid workers in this campaign will not permit its activities to lessen

Gentlemen, I yield to no man in my respect for the actual preventive and curative work that is being done in Tuberculosis, but when I see a child with defective vision, an obstructed naso pharynx, a discharging ear or defective hearing, trying to keep up its school work but failing a grade every now and then, when I see a child with a beginning goitre, a cardiac lesion, an ortho-

*Read before the Fourth District Branch, at Saratoga Springs N Y, September 20, 1929

pedic defect, or hernia, trying to participate in the sports of play ground, then I am convinced that that child's development, health, and future citizenship, are just as important to the community and the State as his Tubercular cousin, and is as much entitled to care and treatment

It was with the purpose of determining the relative frequency of non-tubercular defects among children of school age, as compared with the findings of the Tuberculosis Clinics among the same age groups, that this Survey was undertaken.

In our evaluation of this survey we must give ample consideration to the fact that some 20 general practitioners, none of them specialists along any line, have noted these defects in examinations made under surroundings that tend to distract and disturb, with but little nursing assistance, and that therefore these defects must be outstanding, and that could these examinations have been conducted in a clinic, with trained assistants, and proper diagnostic equipment it may be assumed that the percentage of defects found would run much higher

One of the disheartening things connected with this survey was the great number that remained unexamined at the end of the year

Total school census in age group from 6 to 15 years		12,507
Total children examined		9,903
Defective Vision	1,248	
Discharging Ears	94	
Nasal obstruction	570	
Diseased Tonsils	2,120	
Enlarged Glands	388	
Goitre	88	
Bronchial and Pulmonary	73	
Cardiac	170	
Hernia	32	
Orthopedic	66	
Mental Deficiency	62	
Asthma	1	
Pyelitis	1	
Total defects found	4,913	

Taking the 2,604 unexamined children in this age group and adding to it the pre-school group, estimated by school authorities to number at least 10,000, among all of whom the same ratio of defects may be assumed, we have the rather staggering total of upwards of 10,000 defects in the County among children under 15 which need attention and correction

Many of these defects are disabling at times, causing more or less protracted absences from school, others contribute toward mental sluggishness and an inability to complete their proper education, some tend to provide carriers of disease and constitute a public health problem, others make for a moral hazard in the school and community Nearly all are progressive if uncorrected, and provide the substandard adult, often to the point of mental or physical dependency in later life

Now let us see what the State Dept. of Health has to say as to causes of death among the age group from 1 to 15 years

Between Jan 1, 1920 and Jan 1, 1927, a period of 7 years there were from all causes, 378 deaths, of whom 70 were caused by external causes, leaving 308 deaths from disease Among these we find

Diseased Ears	caused	2
" Nose	"	3
" Heart	"	12
Hernia	"	2

How much defects of Naso Pharynx contributed to the following deaths

Scarlet	32
Measles	11
Diptheria	18

may be left to your individual judgment

During the same period we find that Tuberculosis caused 8 deaths, just the number caused by disease of the ear, nose and hernia, and less than one half the number of deaths from heart disease alone Having collected this data it seemed certain that there existed a very real need for a constructive program looking toward the correction of these defects, and preferably one in which the Profession should be the moving and controlling factor While there are several provisions in law which might be invoked it seemed after thorough consideration that Sec. 44-A of the Public Health Law would best serve us

This Section provides for the appointment of a Public Health Council by the County Board of Supervisors with power to employ Nurses, etc

In our opinion the annual Medical Inspection of school children is a General Clinic, from which the material for special Clinics may be segregated, and at the same time forms the best possible medium for the dissemination of an educational health program, particularly when such inspection is conducted in a careful and impressive manner with the aid of a trained school nurse. This General Clinic should be made to include all the pre-school age group in such School District

After the completion of the School Medical

Inspections, which should be before Nov 15, the Clinics of the Health Council will begin, these to be devoted to a more complete diagnosis of the defect, its degree of severity, and suggestions as to treatment, the complete report of such Clinic to be sent to the family Physician, and to him only

The Clinics of the Health Council will be divided into the Specialty groups as follows Eye and Ear, Nose and Throat, Cardiac, Mental, Gastro intestinal, Orthopedic and Surgical, and Nutritional, each group headed by a Specialist and assisted by the various members of the Society interested along those lines

By the employment of 4 Public Health Nurses in the County it will be possible to give a Public Health, pre school, and pre natal nursing service to all sections of this County, and in those sections of the County not now served by a School Nurse a school nursing service will be supplied Through the medium of these Clinics and the follow up work of these Nurses we hope to impress the parent or guardian with the importance and necessity of proper treatment of the defect, and of his responsibility as a parent or guardian to arrange for the same through his family Physician No one knows just how many parents will be found unable or unwilling to bear the expense of such corrective treatment, but where such are found provision must be made for such corrections at public expense, preferably from a fund set aside for the use of the Council in such cases, and in the use of which no stigma of charity may arise to bar the effectiveness of such relief

Application has been made to the County Board of Supervisors asking for the appointment of a Public Health Council under the Section 44 A, such Council to be headed by the President of the County Medical Society and 4 other members of the Society, together with 3 laymen, it being suggested that they be the Judge of the Children's Court, one of the School Commissioners of the County, and a member of the Board of Supervisors An appropriation of $25,000 for nurses salary, diagnostic equipment, rent, telephone, and as a fund for care and treatment of indigent cases has been requested with the understanding that at least $7,000 of this amount will be met by the State Department of Health, thereby leaving only $18,000, or such part of that sum as may be required, to be raised by the County

When we consider that Saratoga County is now maintaining a child's tuberculosis pavilion at an annual expense of approximately $1,300 per bed, a health camp for undernourished children at a cost of not less than $100 per child, it would seem that the amount we ask to care for upwards of 3,000 children is most modest Having no well organized lay society or well salaried lobbyist to assist us, our request to the county officials has not as yet been acted upon

---

RURAL TYPHOID CARRIERS

From Dr F W Laidlaw's mimeographed District Health Officers' Bulletin.

We have received to date, 16 of the 20 typhoid carrier quarterly reports due from this district Three of the missing ones will come in during the next two or three days—the other one won't, basing our conclusion on past experience Conscientious scruples in regard to answering official correspondence are formidable obstacles

One of the declared typhoid carriers in New York City decided to take a little vacation this past summer, unknown to the city authorities Nearly two months were spent in a summer resort section of our district As a result, twenty cases of typhoid have been reported so far in, or originating in, that locality

Don't have specimens submitted from persons who have been determined to be typhoid carriers, to the State Laboratory or any other laboratory with the idea of securing a release, unless such specimens are secured following a gall bladder removal We recently had a long interview with a physician (not a health officer) who had been impressed with the story of injustice, conspiracy, connivance and persecution related to him by one of the carriers in the district He had sent a specimen from this carrier to the State Laboratory and had received a negative report, and appeared to believe that the carrier should be released and allowed to secure a position as a cook We endeavored to explain that *other evidence* in addition to positive specimens was always taken into consideration in determining typhoid carriers, and that a few negative specimens did not interest anyone familiar with the subject We are of the opinion that our effort was wasted, however, and we are impressed with the vast amount of advice gratuitously bestowed upon those of us engaged in public health work by those to whom the knowledge has come by intuition

THE TREATMENT OF VARICOSE VEINS OF THE LEGS BY CHEMICAL METHODS*

By JOHN E SUTTON, JR., M D., NEW YORK, N Y
From the Clinic of the Cornell University Medical College, Department of Surgery

THE idea of treating varicose veins by the injection of chemicals is not of recent origin, for Pravez, in 1851, advocated the use of persulphide of iron for such purposes In the diary of Dr William M Blackford,[1] under the date of December 8, 1863, reference is made to the use of this drug for the obliteration of veins The early attempts to destroy varices aimed at the production of thrombi and the results were unsuccessful and even disasterous because the solutions used were blood coagulants Modern procedure makes use of strong chemical irritants which are not coagulants Sicard[2] in 1920 reported the sclerosing effect of solutions of sodium carbonate upon veins into which it had been injected, but because of its causticity this solution was soon discarded by him and sodium salicylate was substituted In recent years this chemical method of treatment has become increasingly popular in Europe and Great Britain, and more recently it has been used extensively in the United States

A variety of solutions are being used with success Those more commonly employed are Sodium Chloride 20-25 per cent, Dextrose, Levulose, Invert Sugar, Mercuric Chloride Red Mercuric Iodide, Metaphen, Quinine and Urethane, and Sodium Salicylate Success in this method of treatment depends upon the inflammatory reaction produced by strong chemical solutions when injected into the lumen of the vein The segment of vein into which the solution is injected usually contracts promptly and the endothelium is rapidly destroyed This is followed by the deposit of plastic fibrin and blood clot on the inner surface of the vessel and a thickening of its wall by the production of new connective tissue cells Hyalinization, organization and contraction of this new connective tissue finally obliterates the vein

In selecting the proper solution to be used several factors must be considered first the possible toxic effects, second the nature and extent of the reaction produced in the vein wall and the adjacent tissue, and third the deposit formed on the internal surface of the vein All blood coagulants are by common consent discarded The mercurial preparations, I believe, are potentially if not actually dangerous since the margin of safety between the dose required for therapeutic effect and the dose which will cause toxic symptoms is small The sugar solutions are relatively viscous and heavy and it is necessary to inject larger amounts to obtain the desired effect Sodium Chloride while not possessing toxic potentialities does not produce the best results and its injection is painful Quinine and urethane[3] though painless produces toxic symptoms in certain patients. Sodium Salicylate produces the most satisfactory reaction and the pain produced by its use is counterbalanced by the results obtained The endothelium in the segment of vein treated is destroyed and on this surface is deposited an extremely adherent plastic fibrinous exudate which is held to the vein wall by an extensive proliferation of new connective tissue cells and capillaries

Treatment should always be preceded by a careful history and physical examination Of especial importance is the enquiry regarding femoral thrombosis, phlebitis and milk leg or phlegmasia alba dolens Careful attention should be given to the history of infections which commonly produce these conditions and women who have borne children must be questioned at length regarding the puerperium to determine the possible occurrence of femoral or iliac thrombosis The physical examination should be complete and urinalysis routinely done to rule out extensive nephritis and diabetes Theoretically all foci of infection should be eradicated before the treatment is started, but practically one is limited to the removal of obviously infected areas Focal infections make possible septic phlebitis in the area of lowered resistance produced by the injection

The contraindications to this method of treatment, though not numerous, are very definite *First*—Deep Femoral Thrombosis Trendelenberg's test is of value from a scientific standpoint as it demonstrates the efficiency or inefficiency of the valves of the great saphenous vein Pratt has suggested a valuable test The varices of the leg are closed by the snug application of an A C E bandage, obstructing the superficial venous circulation, and the patient is encouraged to walk for some distance If the deep veins have been previously occluded by a pathological process the entire return flow of blood will have been stopped and violent pain will be felt in the leg after walking a relatively short distance If he can walk with comfort one may be assured that the deep veins are patent *Second*—Chronic Oedema and Lymphangitis resulting from filariasis or other diseases precludes the use of injections *Third*—Intermittent Claudication *Fourth*—General Impairment of the Peripheral Circu-

*Read before the Utica, N Y Academy of Medicine, May 23 1929

lation Strong pulsations in the dorsalis pedis, posterior tibial, popleteal and femoral arteries are desirable in these patients *Fifth*—Recent Superficial Phlebitis It has been recently stated that no injection should be given to such a patient until the tenderness resulting from the infection has subsided, but it is far safer to follow the advice of Forestier "No injection for ten years following a phlebitis" The persistence of viable bacteria in the tissues following an infection is a well-known tact, and the injection of an irritating fluid produces an area of lowered resistance If viable bacteria are already present in these tissues an infected thrombus is a most logical result

Advanced age, while not an absolute contraindication to injections, calls for caution In elderly persons the circulation is less vigorous and the tendency to spontaneous thrombosis is pronounced Patients with high blood pressure suffer no inconvenience and frequently hypertension is greatly relieved by this treatment The injection of varices during pregnancy, though safe, seems unwise since the endocrine imbalance which frequently exists is undoubtedly an etiological factor in the production of varices, and many of these patients improve after labor without treatment Compensated cardiac lesions are no bar to the use of this treatment and the relief afforded is gratefully received True varicose ulcers respond in a remarkable and often spectacular degree after injection of the varices in the leg above them

Sodium Salicylate, in aqueous solution, is preferred for the reasons previously stated In my experience the pain, though at times quite sharp, has not been of great duration (1 to 1½ minutes) and varies relatively in proportion to the amount and strength of the solution used It is first felt at the site of injection, about one minute after injection, and soon radiates downward along the course of the vein This pain is due to a combination of spasm of the vein wall, contraction of the leg muscles and irritation of sensory nerves In an occasional patient, about 1 in 200 there will be symptoms of shock shown by pallor, perspiration, weak pulse, vertigo and nausea without vomiting Adrenalin chloride 1-1000 in doses of five to ten minims, in such an event gives prompt relief

The sodium salicylate can be prepared* by any reliable pharmacist by adding the proper amounts of chemically pure salt to the desired amount of distilled water to make solutions 30%, 40% and 50% The solutions when made should be kept in dark hard glass bottles covered with rubber diaphragms Soft glass is affected by the solution which is thereby changed in chemical composition Sterilization is easily accomplished by placing the bottles in boiling water for ten minutes When thus prepared and stored these solutions keep indefinitely The fresh solution is of a light brown color and if it changes to a violaceous or deep black color a new supply should be obtained

The essential apparatus required is simple and consists of a 5 c c and a 10 c c Luer syringe, preferably with eccentric tips, short bevel, half inch, 25 gauge hypodermic needles of rustless steel, gold or platinum Long bevel needles frequently puncture the opposite wall of the vein and the ordinary steel needles discolor and alter the solutions

Trendelenberg, Jenitzner, Magnus, Sicard, Forestier and Gaugier[4,5] have shown that in varicose veins the current of blood is *not* toward the heart but that it is downward when the extremity is dependent When the leg is horizontal the blood stream is stationary or moves slowly toward the heart and lungs It has been further demonstrated that contractions of the leg muscles draw the blood from the superficial varices into the deep veins

With the patient standing the varices become prominent and the most favorable site for injection may be determined A bulging knot of veins which are adherent to the skin, while easy to puncture, is not the best for injection The adhesion of the skin to the vein prevents the contraction of its wall upon which we depend for the closure of the wound and the prevention of leakage of the solution For that reason a segment of vein which is covered by a small amount of subcutaneous fat is preferred The point for injection is marked with ink and the skin sterilized with alcohol, ether and mercurochrome At the first treatment it has been my custom to use 2 or 3 c c of the 30% solution to test the patient's susceptibility to pain and to determine the amount and extent of the reaction in the vein The syringe filled with the solution is inserted into the needle which is slowly pushed through the skin and the vein wall in an oblique direction with the point downward On entering the lumen the venous pressure is often sufficient to cause blood to flow backward through the needle into the syringe The blood, being of a lower specific gravity than the solution, will rise to the top If the blood does not flow spontaneously gentle withdrawal of the plunger will aspirate it The solution is then injected into the vein at a rate slow enough to avoid distention of the segment being treated, and the needle is allowed to remain in the vein for about 30 seconds to allow the wall to contract about

*Solutions may be secured from a number of drug houses in sterile ampoules, 20% 30% and 40%

it and then it is quickly removed, at the same time pressure is applied over the puncture During the injection the vein wall contracts and it may pull itself from the needle In such an event no more solution should be injected at that site After completion of the injection the patient sits on a stool or the edge of a table and elevates his leg almost to the horizontal, without contracting the leg muscles In this position the leg is supported and pressure maintained on the puncture wound The pain, beginning in 1 to 3 minutes, is cramplike and subsides after about 2 minutes The production of sharp pain immediately on starting the injection is positive evidence of leakage or the introduction of fluid into the perivascular tissue The needle should be withdrawn at once Ten or fifteen c c of normal saline solution if injected into this area, followed by gentle massage, will frequently prevent the development of a slough and extensive periphlebitic reaction

Treatments are preferably given twice weekly The amount and strength of the solutions used varies in accordance with the size of the vein and the type of the reaction following the first treatment As a general rule the larger varices require more solution of greater strength than do the smaller veins, but it is not advisable to inject more than 5 c c of a 50% sodium salicylate solution at one sitting on account of the possibility of too extensive reactions It has been my custom

FIG 1
Bilateral recurrent varicose veins before treatment

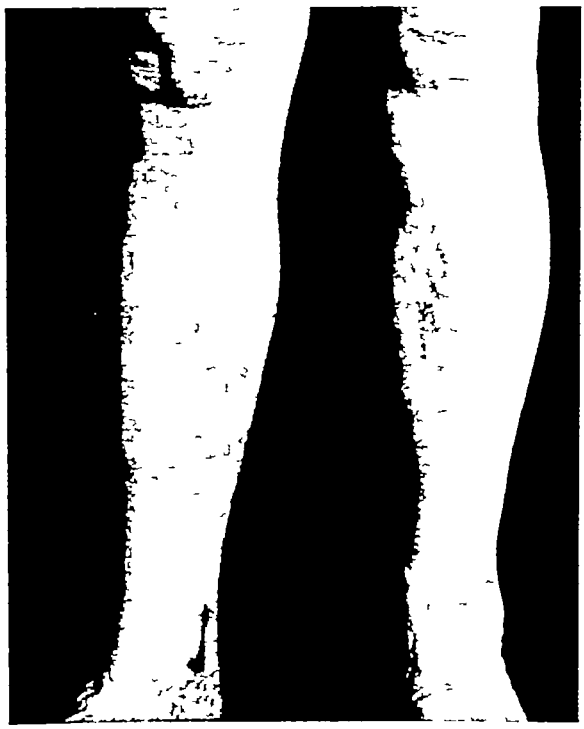

FIG 2
Same as Fig 1 after treatment

to make single rather than multiple injections at one treatment The results are as good and the patient is not subjected to several punctures and the same number of attacks of cramps In cases in which there is general involvement of the great saphenous vein, from the thigh to the ankle, the first injection is usually given just below the head of the tibia into the main trunk of the vein In subsequent treatments the same segment may be used repeatedly until the desired effect is obtained In selecting this site for the first treatment use is made of the fact that the solution passes downward and affects the lower portions of the varices It is inadvisable to give injections in the region of the malleoli because of the more severe pain produced and the greater danger of sloughs After the varices below the head of the tibia have been completely treated, injections are made at the internal side of the knee and in the thigh When scattered varices are present an attempt is made to select one which is in the main trunk leading to varices at a lower level in the leg, but frequently it is necessary to treat these groups individually at different sittings

When the pain has completely subsided firm pressure is applied by means of a (A C E) bandage wound from the base of the toes to the knee, and when the treatments have been given above the knee gauze pads and adhesive strips are used to supply the pressure While the bandage is not an essential feature of the treatment it seems logical to produce as great a collapse of the vein walls as possible since this favors the reaction by approximating the irritated surfaces in the lumen of the vein and prevents its continued distention[6] The patient is allowed to walk home and he is able to do so with perfect comfort He is advised to rest as much as possible during the evening with his leg hanging down The application of heat from a hot water bottle or electric pad during the first evening is comforting and seems to be of some aid to the reaction On the next day he may go about his business as usual, confinement to bed is unnecessary and indeed inadvisable Due to the fact that the current of blood is downward the upright position guards against the remote possibility of embolism

The reaction in the vein appears in from 36 to 48 hours and attains its maximum in about three days The segment injected becomes swollen, firm and moderately tender, and the skin overlying it frequently becomes red The tenderness usually persists for only a few days but may last as long as two or three weeks The thickened vein slowly contracts and is palpable for 4 to 10 weeks Frequently a brownish discoloration appears in the skin over varices which have been treated This is not permanent and it slowly disappears In rare instances there is a diffuse redness accompanied by moderate pain and tenderness resembling a cellulitis This is due to diffusion of a small amount of the solution through the vein wall It usually subsides promptly with the application of dry heat, but occasionally this reaction is more severe and rest with the application of warm wet dressings is required

A section[7] of the thoroughly treated vein shows complete destruction of the endothelium, the internal surface of the vein wall is covered with an extensive plastic fibrinous exudate, and the walls are greatly thickened The fibrinous exudate is firmly adherent to the vein wall and new connective tissue cells and capillary buds are seen growing into it This picture is quite different from that shown by the ordinary thrombus As time goes on the fibrin becomes organized, the new connective tissue cells contract, the vein wall becomes sclerosed, and the lumen of the vein which was once a large dilated varix becomes occluded The varicose vein is thus reduced to a small painless, invisible fibrous cord

In case some of the salicylate solution has escaped into the subcutaneous tissue a slough develops, frequently in spite of the injections of saline solution This first shows itself as a dark discolored spot in the skin near the site of injection, surrounded by an indurated area and covered by a small blister This skin soon becomes black, hard, and dry and the induration persists for a long time This eschar is the result of a chemical burn Excision of this with primary closure, though advocated by several authorities, is unwise. Just as it is injudicious to incise the area of any burn so is it dangerous to excise this chemical burn This complication while annoying and troublesome is usually not serious The eschar separates slowly and the resultant ulcer heals only after weeks or months Fortunately this occurs seldom and can usually be avoided by exercising proper care

The length of time required to complete the treatment varies with each individual and cannot be predicted As a rule one injection of 3 c c of a 50% solution of sodium salicylate will produce an adequate reaction in from 3 to 6 inches of vein In one patient the result may be prompt while in another whose condition appears to be about the same, the vein slowly becomes thickened after numerous injections

Kilbourne[8] in a recent paper dealt with considerations of safety in the treatment of varicose veins of the legs In reply to a questionnaire sent to the large American hospitals he received data on 4,607 patients who had been treated by surgical removal of the varices In his study of the literature there were available about 50,000 cases in which treatment was given by the injection of chemical solutions In this comparative study he concluded that the mortality following the surgical removal of varicose veins was 1 in 250, while the mortality following the treatment by chemical methods was less than 1 in 4,000 Recurrences after surgical removal averaged 30%, while the injection treatment scored 6% Making due allowance for the fact that the statistics dealing with the mortality rate and the incidence of recurrence in patients treated by this ambulatory method are not as complete as those obtained from the hospitals, these figures are extremely impressive

In this ambulatory treatment of patients with varicose veins the factors of safety are so great and the economic advantage so overwhelming that there can be little doubt as to which method of treatment is for the best interests of the patient

Summary

1 Sodium salicylate in aqueous solution, 30, 40, and 50%, gives the best results The transitory pain produced by its use is counterbalanced by the good results obtained

2. Contraindications, a—femoral thrombosis, b—chronic œdema and lymphangitis, c—intermittent claudication, d—general impairment of the peripheral circulation, e—recent superficial phlebitis

3 Caution should be used in treating patients of advanced age

4 Complete history, physical examination and urinalysis is essential Eradication of foci of infection is advisable

5 Treatments are given twice weekly with the injection of one segment of vein Following the injection a pressure bandage is applied from the base of the toes to the knee or adhesive strapping used in its place

6 Confinement to bed is unnecessary and inadvisable

7 Sloughs following leakage of solution into the perivascular tissue should not be excised Allow spontaneous separation of dead tissue

8 The factors of safety are overwhelmingly in favor of the treatment by injection of chemical solutions which are not blood coagulants

STUDIES IN INTESTINAL INTOXICATION

Toxicity Appraisal of Intestinal Bacteria by a New Method

By CLARENCE W LIEB, A M., M.D, and GEO H CHAPMAN, B A.Sc., NEW YORK, N Y

FROM the diagnostic standpoint, the usual bacteriological examinations of feces are almost as unsatisfactory as chemical analyses Determinations of toxicity from the former standpoint are largely a matter of deductive reasoning or are based on unreliable animal experimentation. On the other hand, the quantitative determination of toxic chemical substances gives us no hint whatsoever as to the actual amount of their absorption through the intestinal wall Individual resistance, mucous membrane integrity and bacterial toxicity are among the factors which must be considered in combating intoxications of intestinal origin. This, and subsequent articles will describe the results of our efforts to elucidate some of these factors

Dudgeon (1) has summarized our knowledge of fecal bacteriology but, like many other workers, his conclusions are based on the frequency with which certain bacteria are found in the stools of invalids This is a poor criterion as many of these bacteria may be derived from food and from the respiratory tract. Many of these abnormal forms are apparently non-toxic A more critical but less technical survey of the intestinal flora is excellently presented by Cruikshank (2)

When pathogenic bacteria like B typhosus or B dysenteriae are found in feces, we infer that the host has an infection with the respective organism or is a carrier of it There are, however, a number of bacteria, generally considered nonpathogenic, which sometimes produce chronic infections light enough to allow the host to continue his daily duties, but which occasionally give rise to acute symptoms severe enough to force him to seek medical advice This group of bacteria may cause diarrhea, symptoms of intestinal intoxication, mucus colitis, mental disturbance and a number of other conditions believed to be due to a change in the intestinal flora, but the etiological relationship is often difficult to establish

Numerous attempts have been made to study the flora in these cases in an effort to find the toxic agent Some workers have confined their efforts to differentiating the "type" of flora into "putrefactive," "fermentative" and "mixed" This classification was based on erroneous conclusions regarding the metabolism of certain bacteria and to a lack of knowledge of the term "putrefactive" Since these studies gave no clue to the species of bacteria causing the changed flora, they were generally discarded in favor of more exact bacteriological methods

Dudgeon (1) outlined a method for the quantitative study of bacteria in feces, and Torrey (3) has also described a series of methods applic-

able to this type of work Both these authors depend largely on finding bacteria which are known to be pathogenic under certain conditions and upon their presence in increased numbers Hines (4) has applied this principle to the study of C welchii in cases of diarrhea He found an increase of this organism in many cases Basing our observations on a quantitative and identative examination of over 3,000 stools, we have come to the conclusion that, based on the number of bacteria present, an exact interpretation of the etiological role of the bacterial flora is not only difficult but practically impossible In some stools from apparently toxic sources, we were unable to recover any bacteria and only after repeated examinations on these patients were we able to occasionally isolate a few colonies On the other hand, stools containing a marked increase in some bacteria were often from patients with negligible intestinal symptoms

The most striking instance of the latter observation was the finding of a very marked increase in vegetative and spore forms of C welchii (5) in two explorers who had voluntarily subsisted on an exclusive meat diet for a year Repeated examinations during their exclusive meat diet regimen has shown that the total numbers of C welchii in their stools were greatly in excess of those found in any other specimens examined in this laboratory Both of these subjects were subjectively and objectively normal at the beginning of the experiment They had, at that time, a fecal C welchii count well above the average They lived on an exclusive meat diet for a year and during this time their C welchii count increased by several thousand times that which they had on a mixed diet, without any impairment of health whatsoever Since these men have returned to a mixed diet, the numbers of C welchii have approached normal limits A complete report and discussion of these C welchii studies is to be made in a separate paper

Stewart (6) has shown that the number of some non-lactose fermenting bacteria fluctuates with the patient's mental condition and the parallel between the two is remarkably close, emphasizing the importance of collecting stool specimens when the patient's symptoms are exaggerated But since organisms like the Morgan bacillus were found by him in normal controls, we felt that a measure of toxicity or virulence would assist in determining their importance This differentiation between normal and abnormal strains seems advisable for the entire group of intestinal bacteria Torrey (3) has suggested mouse inoculation for testing the virulence of B coli, but it has not proved successful in our hands It is expensive for routine use especially if several strains are to be tested from one stool specimen We have not found his method reliable because the number of viable bacteria present in a 24 hour broth culture is quite variable and determines, to a large extent, the results of mouse inoculation We often found that the effect on mice was proportional to the number of living bacteria injected This has also been observed by the senior author in the case of tubercle bacilli (10)

Falk has recently described (7, 8) a method for the determination of virulence (toxigenicity) of B diphtheriae and related bacteria by an electrical method This method, known as electrophoresis, consists of applying a voltage to the bacteria and noting their speed This speed is closely related to the virulence of diphtheria bacilli and the reader is referred to Falk's articles for a full discussion of the method and its significance He had previously shown that (9) the speed obtained by this method bore a distinct relationship to the virulence of pneumococci It occurred to us that, if such a relationship were found to exist for the intestinal group of bacteria, it would prove of inestimable value in differentiating a normal from an abnormal intestinal flora The present study was undertaken to investigate this phase of the problem so far as the B coli group was concerned

The intestinal bacteria were isolated and identified on Levine's eosin methylene blue medium and blood agar and the various types of B coli, A aerogenes, proteus, and other Gram negative bacilli were transplanted to a special medium which was designed to rigidly control the hydrogen-ion concentration of the resulting growth This medium was a plain agar to which had been added 15 gms each of primary and secondary sodium phosphate and enough bromthymol blue as an indicator Unless these large amounts of phosphate are added, the reaction of the growth will show large variations in less than two hours After three hours incubation, the plates are examined immediately If there is any delay in examining them, they should be stored in the ice box to prevent further growth Since the growths are quite young, washing is unnecessary The organisms are consequently suspended directly in fat-free distilled water

The modified technic, as used by us for the B coli group, is as follows The organisms are streaked on plates of the special phosphate medium described above One plate will hold streaks from eight strains of bacteria Among these are included a toxic and a non-toxic strain, whose speeds are known, to be used as standards After three hours incubation, the bacteria are suspended in fat-free distilled water Chemically clean capillaries are filled with this suspension, put in the cell which has been connected to a 45 volt battery, and focused under the microscope The switch is closed and the speeds are observed with a stopwatch Five observations are made and the polarity of the cell is then reversed A second set of five determinations is made in this reversed direction The capillary tube is now replaced by

a second one which has been filled with the same suspension The speed is observed as with the first tube and the results compared They should check within 4 per cent In case of a disagreement, other capillary tubes are used until uniform results are obtained Under these conditions, the standard strains, which have been used as controls, should give speeds which have been shown by experience to be constant for them With these controls and the use of more than one capillary tube, we have a very accurate method of determining the speed of the bacteria and one, which, in our experience, will always give comparable results When these speeds are calculated in microns per 1000 volts per second, we call this the "toxigenic index" Determinations of this index were made on several thousand strains and it was found that

Non-toxic strains had an index above 60, while Toxic ones had an index below 60

Grades of toxicity were distinguished as follows

Below 45	Very toxic
45-50	Toxic
50-55	Moderately toxic
55-60	Slightly toxic

The clinical use of this index has given us a new light on intestinal bacteriology We found that we were able, in most instances, to distinguish a normal from an abnormal stool by the presence or absence of toxic strains of B coli The exceptions were, generally, infections by streptococci or C welchii (Bacillus aerogenes capsulatus, or the gas bacillus) In the former instance the stool is usually poor in bacteria due to inhibition of B coli by streptococcus toxin In the latter we usually observe a marked increase in C welchii but the strains of B coli have normal toxicity indices

The clinical application of the toxicity index is far reaching It enables the physician to rapidly determine the possible rôle which one or more types of organisms, isolated from the stool, play in the causation of the symptoms or signs of disease It places the preparation of vaccines on a higher scientific scale and thus makes vaccine therapy more specific The toxicity index as determined by a skilled bacteriologist, therefore, ranks in biological importance with agglutinin, precepitin, opsonin and complement fixation reactions in laboratory diagnosis

DIABETIC SURGERY WITH CASE REPORTS

EDWARD S VAN DUYN, M D, AND MAYNARD E HOLMES, M D, SYRACUSE, N Y
From the Departments of Medicine and Surgery, Syracuse University, College of Medicine

THERE is perhaps no other disease which has more surgical complications than diabetes In addition to the usual surgical conditions to which all are heir, the diabetic is prone to gangrene, cellulitis, boils, carbuncles, osteomyelitis and gall bladder disease In the surgical diabetic certain unusual conditions exist, first surgical infections tend to seriously aggravate the diabetes and second the disturbed carbohydrate metabolism renders the surgical complication worse and more difficult to control Hence it becomes imperative therefore for the satisfactory management of the surgical diabetic that the treatment be carried out jointly by the internist and the surgeon

Diabetics are impaired surgical risks because, (1) tissues do not heal well in the presence of the persistent hyperglycemia, (2) their resistance to infection is poor and (3) diabetic acidosis and coma may develop after operation Before the advent of insulin the surgical mortality among diabetics was about 40%[1], only necessary surgery being attempted Today with insulin the whole picture has changed, the surgical mortality has dropped to approximately 12%[2], not only is emergency surgery allowable but today no limitations should be placed on the diabetic in the treatment of surgical disease that is not placed on the normal person provided of course that adequate medical management of the diabetes is available

The outcome of surgical conditions in diabetic patients is in great part dependent on the preoperative and postoperative care which is largely a medical problem By rendering the patient nondiabetic with diet or diet and insulin his resistance to infection is improved and the healing power of the tissues promoted On the other hand insulin will not improve the circulation in an extremity where marked vascular disease is present

The acme in the medical management of these patients before operation should be, (1) elimination of acidosis by keeping the urine ketone free, (2) keeping the urine sugar free and the highest blood sugar of the day under 150 mg per 100 cc (3) overcoming dehydration with adequate

fluid intake The common practice of examining only one specimen of urine a day is often misleading and should be condemned Treatment should be guided only by analysis of daily 24 hour specimens The diet should be rather high in carbohydrate at least 100 grms to insure ample glycogen store for the needs of the operation and thereafter Protein is given up to one grm per Kilogram of body weight and fat enough to furnish the total caloric requirement There is no reason for restricting the fat below the Woodyatt ratio if the urine is kept sugar free

The great danger to be feared after operation is the onset of severe acidosis and coma incident to the infection, vomiting and starvation which accompany most surgical conditions Here a nurse, preferably one trained for this work is very helpful All voided specimens are examined for sugar and diacetic acid and an appropriate dose of insulin given at intervals of 3 to 4 hours If complete reduction of Benedict's solution is obtained 30 units of insulin should be given, if reduction is moderate 20 units and if slight 10 units should be the dose If diacetic acid is still present in the urine after the sugar has cleared methods should be instituted to increase the patient's intake of glucose to insure its presence in the urine as long as the acidosis persists Orange juice and other fluids should be given as soon as possible after operation, they generally can be retained within a few hours To combat dehydration 2-3000 cc. of fluids should be retained in 24 hours by mouth, rectum or under the skin In the uncommon case where adequate glucose cannot be given by mouth it may be administered in 6 ounce retention enemas of 5-10% solution, under the skin in 5% solution or intravenously in 10-20% solution When soft and solid food can be taken it should be given in the same manner as before operation with insulin if necessary If a patient can be rendered sugar free with an adequate diet there is no necessity for insulin and not a few cases can be managed without its help, however the vast majority require it especially where infection is present

The anaesthetic in the diabetic is important Ether and chloroform should not be used because of their tendency to increase the blood sugar and acid bodies, also to cause nausea and vomiting Ethelne or spinal anaesthesia should be the methods of choice

Where pus or acute infection is present as in carbuncles, cellulitis or appendicitis no time should be lost by withholding surgery because the diabetic condition will be markedly improved by the resultant abatement of the infection Before operation 30 to 50 units of insulin should be given if the blood sugar is high and there is much sugar and diacetic acid in the urine If acidosis is absent or but slight, insulin may be postponed until after operation These cases demand constant attention after surgery until all danger of acidosis and coma have passed

Often it is possible today to save an extremity by local surgery and careful control of the diabetes, ulcers, soft tissue infections and certain types of osteomyelitis can be successfully treated in this manner Osteomyelitis plus gangrene demands immediate high amputation as soon as evidence of gangrene appears The wet type of gangrene is primarily due to infection with secondary thrombosis of narrowed vessels, here high amputation is indicated

Dry gangrene on the other hand is primarily vascular and is no different than the senile type Here some delay is justified until a line of demarcation becomes definite. Amputation of a toe will often heal, the wound should always be left open and allowed to fill in

The presence or absence of pulsation in the dorsalis pedis artery and the *x*-ray are very helpful in determining the condition of the peripheral circulation In general where pulsation is present in the dorsalis pedis artery and other factors are favorable an attempt should be made to save the extremity by local surgery and control of the diabetes Of course amputation will ultimately have to be done in some cases but if an extremity can be saved only occasionally by this conservative treatment it is worth while

On the other hand with evidence of marked vascular changes by *x*-ray and absence of or feeble pulsation in peripheral vessels high amputation should be the rule One cannot stress to strongly the importance of early intervention with high amputation where there is spreading cellulitis and evidence of impaired circulation Conservative surgery here gives a much higher mortality than radical mid thigh amputation

The following brief case reports have been selected from the surgical department of the University Hospital to illustrate certain important points in the management of the surgical diabetic. All patients have been conjointly treated by the medical and surgical staff

Case 1 A man, age, 25, had severe diabetes for 18 months, taking insulin twice a day Two abscessed teeth were extracted and in a few hours fever, swelling about tooth sockets, anorexia, vomiting and drowsiness developed This condition progressed until admission 36 hours later The patient was well into coma, the urine was loaded with sugar and diacetic acid The usual coma treatment was instituted to which the patient responded with some difficulty

This case shows the great danger of undertaking even a minor surgical procedure in a diabetic especially where infection is present without adequate control of the diabetes before and after operation Had proper preoperative and postoperative care been given, this near catastrophe would not have happened

Case 2 A female, age 56, was admitted with a carbuncle on buttock of several days duration, anorexia and drowsiness had been present for three days Diabetes had been present for 2 years and patient was taking 10 units of insulin a day The urine showed large amounts of sugar and diacetic acid The carbuncle was incised and the onset of coma checked with 40 to 60 units of insulin a day The carbuncle quickly healed and the patient was discharged taking 40 units of insulin a day in place of the inadequate dose of 10 units on admission

Case 3 A male, age 55, was admitted with a red and swollen nose of 4 days duration The swelling had spread into the cheek and forehead, the right eye was closed The temperature was high and the patient was very ill, a diagnosis of erysipelas was made. Diabetes had been present for years, the blood sugar was 242 mg per 100 cc and the urine showed considerable sugar and diacetic acid The urine was rendered sugar free in 24 hours with 130 units of insulin and the sugar and acid bodies were controlled thereafter with daily doses of insulin The infection subsided, the acidosis cleared and the patient was discharged in 2 weeks

Here the great danger of infection to a diabetic is illustrated Infection lowers the tolerance for sugar and acidosis quickly develops making the use of insulin imperative in these cases Had this treatment not been carried out both patients no doubt would have died of diabetic coma incident to the severe infection The indication for prompt surgical relief of the infection is shown in case 2 The infection in each case seemed to abate as the diabetes was brought under control

Case 4 A female, age 47, was admitted with severe abdominal pain at site of ventral hernea for 24 hours, vomiting and evident intestinal obstruction, incident to the strangulation was present Sugar and diacetic acid was present in the urine and the blood sugar was 300 mg per 100cc 40 units of insulin was given and the strangulation reduced under local anaesthetic Thereafter the urine was rendered free of sugar and diacetic acid with daily doses of insulin, 20 to 60 units On discharge no insulin was necessary, diet alone controlling her diabetes

This case is a surgical emergency in a diabetic with severe acidosis The preoperative and postoperative care contributed in great part to the satisfactory outcome Without insulin coma and extension of infection no doubt would have developed

Case 5 A male, age 64, was admitted on June 25, 1927, with gangrene of left fifth toe Discharging ulcer had developed at base of left 5th toe in February 1927, diabetes was first noted in May 1927 The infection spread into the foot involving the soft tissues and tendons extending along the lateral side of the foot and finally involving the tendon achilles Pulse was present in the dorsalis pedis artery and x-ray showed no vessel change The blood sugar was 200 mg per 100 cc and sugar was present in the urine The diabetes was controlled with diet alone Local surgery was performed on the foot in all 10 times, the 5th toe and metatarsal bone were removed also sloughing tissue was cut away and drainage facilitated The last operation was performed on September 4th and the patient was discharged on October 3rd 1927 There was some deformity of the foot, however the patient returned to his usual work and has continued so to date

Case 6 A male, age 60, was admitted on May 30, 1927 with gangrene of right 2nd toe of two weeks duration Pulse present in dorsalis pedis artery x-ray showed no bone involvement or vessel change Sugar in urine for past 7 years, the blood sugar was 300 mg per 100 cc Urine kept sugar free on diet alone without insulin The gangrenous toe was removed and the patient was discharged on June 19th with wound healing He was readmitted on August 20th with lighting up of infection in wound and gangerene of right 3rd toe This toe was removed and the urine was again rendered sugar free on diet alone The wound healed and the patient returned to his work and has continued so to date.

These two cases illustrate what can be done by local surgery and careful control of the diabetes Where the circulation of an extremity is still adequate and the patient is willing to spend the time necessary an extremity can often be saved by this conservative management In case 6, the exacerbation of the infection while at home and its control again in the hospital when the urine was again rendered sugar free is noteworthy The diabetes in each case was controlled with diet alone showing insulin to be unnecessary in some cases

Case 7 A male, age 63, was admitted on March 3, 1926 with gangrene of 3rd right toe of two weeks duration, extending into foot The urine showed a large amount of sugar, the blood sugar was 266 to 400 mg per 100 cc. 20 to 60 units of insulin a day was necessary to control the diabetes There was no pulse in the dorsalis pedis artery Petechiae were noted on the arms and legs on March 7th The right leg was amputated at mid thigh on March 12 and patient died on March 18, 1926

Here is shown the danger of delay to amputate where there is extension of the infection in the presence of marked vascular disease The petechiae no doubt pointed to a septicemia which frequently develops if amputation is delayed too long and which makes the outlook almost hopeless

Case 8 A female, age 52, was admitted on June 2, 1926 with discharging ulcer at base of 4th left toe for 6 months Sugar was present in the urine and the blood sugar was 322 mg per 100cc Urine kept sugar free with 20 to 60 units of insulin a day X-ray showed osteomyelitis to be present There was no pulse in the dorsalis pedis artery At her request only local surgery was performed on June 14, diseased bone being removed The wound failed to heal and amputation was performed at mid leg on August 22 This wound healed and the patient was discharged on September 7, 1926

This case is sighted as one of osteomyelitis of the tarsal bones where local surgery failed and later amputation became necessary Where there is osteomyelitis of the tarsus present, amputation with generally be necessary especially where there is evidence of impaired circulation The next case also illustrates this point Although the mid leg amputation healed in this case it usually will not because the narrowest point of the sclerosed vessels is often in the first part of the popliteal arteries [3]

Case 9 A man, age 51, was admitted on April 2, 1926, with an ulcer at base of third right toe, for 4-5 months A gangrenous toe was removed from same foot 18 months previous Diabetes had been present for years, the blood sugar was 238 to 125 mg per 100 cc Urine kept sugar free with diet alone There was no pulse in the dorsalis pedis artery X-ray showed evidence of osteomyelitis of the tarsus and marked vascular change On April 9th third right toe and metatarsal bone were removed, the wound was closed with drain Infection spread into foot and was unrelieved by opening the wound Mid thigh amputation was performed on April 19, 1926 and patient died the following day

Case 10 A woman, age 57, was admitted on October 22, 1928, with gangrene of third left toe The tip of third left toe had been black for four months and a few days before admission the nail was removed because pus had formed under it. This procedure was followed by rapid extension of the infection, patches of gangrene appeared about the ankle and the foot and part of the leg became dusky in color The patient was very ill with a temperature of 100° to 104° F Before admission there had been much pain in the foot and there was no impulse in the dorsalis pedis artery Rather severe diabetes had been present for two years The urine was kept sugar free with 20 to 50 units of insulin a day A streptococcus blood stream infection was found on October 23 The patient refused amputation and died on November 1, 1928

The danger of conservative surgery is illustrated in these two case reports In a diabetic where impaired circulation and infection is present in an extremity, local surgery will often set up rapidly spreading cellulitis and moist gangrene In case 9, the danger of wound closure in this type of case is shown The promptness with which blood stream infection developed when amputation was delayed is striking

Case 11 A woman, age 35, was admitted with slight pain in appendix area, nausea and anorexia for 24 hours Untreated diabetes had been present for three years and a large amount of sugar was found in the urine Examination revealed only slight tenderness and no rigidity over the appendix The white count was 7500 with 72% polymorphonuclears Immediate operation was decided upon The appendix was found acutely involved covered with plastic exudate, the findings were much worse than the symptoms indicated The urine was kept free of sugar and diacetic acid after operation with 40 to 60 units of insulin daily The convalescence was uneventful

This case is sighted to show that symptoms of appendicitis in a diabetic although slight should demand early intervention The diabetic does not react to pain and infection as the normal individual hence the danger of spread of the infection without recognition [4] Had operation been delayed here as the symptoms ordinarily would warrant peritonitis would no doubt have developed Other acute surgical conditions of the abdomen in the diabetic should be considered in like manner It might be well here to caution against the possible error of mistaking severe acidosis in a diabetic for appendicitis Severe acidosis may cause sharp abdominal pain, nausea, vomiting and at times an increase in leukocytes The history, urine and blood examination together with other signs of acidosis and coma make the diagnosis

Summary

1 Where the circulation is adequate in a diabetic conservative treatment of surgical conditions of the leg and control of the diabetes will often save an extremity

2 In the presence of impaired circulation in a diabetic, spreading infection in an extremity should demand immediate high amputation

3 In the diabetic immediate surgical relief of infection is indicated with control of the diabetes thereafter

4 Any surgery in a diabetic, even minor, especially if infection is present, demands careful control of the diabetes before and particularly after operation

5 Where the circulation of an extremity is impaired in a diabetic local surgical treatment for infections of the leg will often set up a rapidly spreading cellulitis and gangrene.

6 Symptoms of appendicitis in a diabetic even though slight should demand early intervention

7 In the management of the surgical diabetic cooperation between the surgeon and the internist is essential

TREATMENT OF GENERAL PERITONITIS

By R. FRANKLIN CARTER, M D, NEW YORK, N Y

From the Department of Surgery, Post Graduate Hospital

THE treatment of a patient with general peritonitis is a challenge to the best in every institution All the functions of the hospital are brought into play, and nothing but the best will succeed The reward is complete recovery The situation is always dramatic and of great interest, as no two patients require the same in the exercise of judgment At the head of this action stands the surgeon upon whom the responsibility for the outcome depends There is no other situation in the practise of medicine in which judgment of what to do and when to do it plays so great a role That great teacher, experience, is still a necessity in the development of good judgment However, there are means of assistance in every complete hospital upon which dependence may be placed in arriving at a conclusion

The etiology of general peritonitis does not materially change the nature of the case except in the type of organisms present, and the individual resisting powers of the patient to the particular strain of bacteria The streptococcus and pneumococcus produce the type of general peritonitis most difficult to cope with The non hemolysing strains of the former organism singly or in company with the colon bacillus produces the type best suited for general consideration

The factors for consideration in dealing with this subject are The surgery that is to be employed to deal with the source of the infection, the prevention or the relief of ileus, and maintenance of an adequate state of nutrition In addition to the above factors in the case of pneumococcus peritonitis there is the additional feature of specific theraphy with antibody solutions This, however, is still in the experimental stage

Whenever the question of surgery in peritonitis comes up drainage soon appears, and there the discussion finally ends in dispute No problem in surgery has received more attention than this one of drainage A survey of the literature soon convinces one that the principle is fundamentally wrong either in its inception or execution The most carefully carried out experiments which show the futility in trying to drain the general peritoneal cavity for any length of time by men whose veracity and ability are not to be questioned have failed to quiet the controversy over this question The old adage, "when in doubt drain," is still quoted and no doubt practised But it appears to one that there are five rational reasons for drainage The presence in the abdominal cavity of urine, bile, and intestinal content, a gangrenous area which cannot be removed and which will later liquefy and slough away, such as an abscess wall, and in instances where hemorrhage may occur in the presence of a slow ooze from a raw surface to prevent hematoma, and when there is active bleeding either from slough or an area which cannot be securely controlled by ligature The drainage material employed has been as varied as it is possible for it to be Every type of plug and pipe has been used to prevent and encourage the flow of peritoneal exudate. Soft substances such as gauze enclosed within either rubber tissue or a soft rubber sheath are less harmful and establish a tract down to the site of the abscess as well as solid tubes except in deep cavities such as the subhepatic space or pelvic cavity In such places the channel may be left tortuous by the bending of the softer tubes by the edge of the liver or coils of intestine, and a straight sinus may be formed by the introduction of a stiff rubber tube wrapped with gauze Tubes in themselves drain for only a short time before becoming plugged with fibrin and more drainage material will escape around the drain than thru it regardless of the nature of the drain Removal of drains should not be done before the sixth to eighth day at which time the walls of the tract have been securely formed with fibrinous exudate, the wall of the abscess cavity will have begun to liquefy, and the gauze covered tube will escape from the tract without causing pain as the fibrin filled meshes are freed by liquefaction

Thoracodotomy advised and practised for a time seemed to offer a good deal in the way of eliminating toxins and pathogenic bacteria But when subjected to experiment upon animals it did not prove to be a procedure of value

Repair of the injured viscus or the removal of a gangrenous mass should be done when the patient will stand it. And as there is no yardstick with which to measure the stamina of an individual, the time and type of surgery is a matter of judgment. The patient may be lost or saved by immediate operation, the same is true for delay

The prevention and relief of distension in peritonitis is another cause for a variety of opinion and heated debate, therefore interesting The methods employed for emptying the stomach and intestine have seemed to spring from the hand rather than the head, in that the causes or what would seem to be, have received little consideration Distension is not due to the lack of evacuation of the rectum for three or four or even ten days For without irritation either within or without the gut and starvation of the musculature of the wall of the gut an individual does not distend when the bowels do not move. Ileus of this type has been termed properly, paralytic. The usual tone is disturbed, and the intestine dilates with the resulting distension of the abdomen With the exception of marked dilatation of the stomach, this distension is in general of more concern and distress to the surgeon than to the

patient Various experimental and clinical reasons have been given to account for the dilatation of the intestine Many of them seem logical upon an anatomical and a neurological basis However, when concerned with prevention and relief it seems permissible to account for the dilatation by the evident existing causes which are infection and inflammation of the peritoneal surface The fact that paralytic ileus may be caused in other ways should not detract from this contention And the fact that it occurs in general toxemias, cord and central nerve lesions should not deter one from believing that in this instance it is the result of starvation of the musculature of the intestinal wall, resulting in a partial or complete paralysis The gaseous content of the intestine is probably the result of an increase in the amount of air swallowed and a lack of ability on the part of the intestine to convert or absorb the usual products of bacterial putrefaction Dilatation of the stomach and proximal jejunum with lower intestinal content is thought to be the result of reverse peristalsis Clinically, the distension can be made to increase by adding to the irritation of the peritoneal surface that of handling and exposure to the air by irritating the mucous membrane surface with cathartics and enemata, and by further depletion of the vital sources of energy of the individual Likewise, distension may be avoided and relieved by attention to the above causes First, all operative procedures should be done with as little mauling and exposure of the intestine as possible Second, no cathartic and no medicated enema should be used Also pituritin and eserine are harmful in that they completely exhaust the tired gut muscle Partial relief and the expulsion of large amounts of gas from an intestine in this state is followed in the course of an hour by more marked distension Small doses of strychnine given during the course of the distension are of assistance as a tonic and do not produce spastic contraction Enemata of warm olive oil or saline solution are indicated when rectal examination reveals the presence of feces A small rectal tube inserted for two inches and left there will permit the escape of the gas upon reaching the rectum, also any fluid feces A caecostomy except in the presence of a mechanical obstruction does not relieve the distension The rectal tube left in place does as much

Daily colonic irrigations given with two tube method, using warm normal saline will keep the rectum and lower sigmoid free of feces and are of great assistance in getting rid of intestinal gases Also an undetermined amount of water is absorbed Previous to giving a colonic the patient should be given an injection of morphine to induce sleep if possible, while the colonic is being given

A duodenal tube inserted thru the nose and into the first portion of the duodenum will keep the stomach and duodenum from distending with feces and gas This procedure is far more effective than high jejunostomy, and is not attended by the other disagreeable features of jejunostomy operation, drainage onto and sloughing of abdominal wall and necessity for closure. Flushing the tube with warm saline solution every two hours keeps up the flow or the patient may be allowed to drink water of ordinary temperature which will flush the tube and also add greatly to the satisfaction of the patient

The restlessness and nervous irritability of the patient should be controlled completely by morphine In this way less air is swallowed and less energy consumed by meaningless movements

The foregoing matter pertaining to surgery, drainage and the control of ileus is important, but from experience it would seem that the outcome in an instance of general peritonitis depends more upon the type of the infecting organism and the maintenance of an adequate state of nutrition than upon the other factors involved The latter factor is agreed upon by all, therefore, it excites less comment and disagreement, and unfortunately less interest Too often it may be left to the judgment of the interne or even the nurse to direct the administration of food and fluid The resistance of the individual depends upon an acquired or inherited ability to deal with an invading infection One may acquire or inherit this ability to a varied degree, nevertheless this action, as all others, consumes energy Energy is dependent upon the organs of internal metabolism The organs of internal metabolism function when not diseased and when supplied with suitable raw products Therefore, the non-specific element in the action of resistance to infection is directly dependent upon the action of the organs of metabolism The source of the supply of energy producing products lies in that carbohydrate, fat, protein, minerals and fluid stored up within the tissue spaces of the body and in the daily intake of these substances thru the intestinal muscosa, and the oxygen in breathing The excretion of the end products and poisonous by-products is chiefly by way of the kidneys and lungs

Attention to this process as a whole reveals many interesting changes from the normal under the conditions existing in the presence of a general peritonitis In the presence of high temperature, severe toxemia and the destruction of tissue the metabolism is greatly increased And peculiar to this type of toxemia the source of supply lies in those products previously stored in the body spaces, as the usual port of entry is blocked The most important and readily used element, free carbohydrate, exists in relatively small amounts as glycogen Therefore, it becomes necessary to begin the administration of carbohydrate early and by other means Intravenous solutions of ten percent glucose are well tolerated,

and when free from protein cause no reaction Subcutaneous injections of three per cent solutions are readily absorbed, and are useful in those patients with failing heart muscle and edema of the lungs Its use by rectum is contraindicated in the presence of abdominal distension When only moderate distension exists twenty per cent solutions in six ounce amounts every four hours are useful except in very restless patients The rectal tube should be passed free before every fresh injection to prevent distension of the sigmoid and colon with fluid The Murphy drip method is not reliable in that fluid given in this way may cause great distension and distress without the attendant nurse knowing it By frequent retention enemata one is assured of only six ounces being present at any one time A minimum of two hundred fifty grams of carbohydrate per day for the adult should be administered when the patient has not been allowed to starve for several days If starvation has occurred the amount should be increased by increasing the intravenous solutions to twenty or even thirty per cent. The subcutaneous solutions should not be increased

Fat is stored within the tissue spaces in sufficient quantities, and no additional fat should be given Its complete use is dependent, however, upon the carbohydrate, and when sufficient carbohydrate is not available the incomplete products of fat metabolism become a menace, and the resulting acidosis so often seen in these patients is a warning and an indication for the need of carbohydrate

Protein administration by artificial means is impossible, its consumption or destruction to furnish carbohydrate is unfortunate. The vital structure of important organs of the individual is dependent upon protein and splitting of proteins to form carbohydrate necessarily weakens those organs A rise in the blood urea content in these patients is an indication for the administration of more carbohydrate

The vomiting or syphoning away of the gastric content is accompanied by a reduction in the blood chloride content Replacement of blood chlorides by the addition of sodium chloride to the solution of glucose is very important A low blood chloride is usually accompanied by an increase in the CO_2 combining power of the blood and maintaining the normal or replenishing the chlorides will usually prevent and relieve the state of alkalosis noted in these patients The intravenous glucose solution should be made up with normal saline, in this way twenty to thirty grams of chloride are given every day—when more is needed to keep the blood chloride content normal a two to four per cent saline solution can be given slowly Chlorides are absorbed readily by rectum, and when the rectum is tolerant sufficient can be administered with the retention enemata to maintain a normal blood content

Water is the vehicle for carbohydrate and chloride, but it is not a convenience It is of prime importance in both the metabolism and excretion of by-products Twenty-five hundred c c to three thousand c c per day is required, and one should begin with that much water as a basis

The organs of metabolism function when not diseased, and when furnished with suitable products This assumption involves a principle other than that of giving carbohydrate, it must be metabolized Frequent blood analysis with the blood sugar determination in patients with peritonitis who had taken no carbohydrate for several days has shown in the late stages of the toxemia a rise in the blood sugar, usually accompanied by a rise in urea While post-mortem examination has not shown the pancreas to be changed it is possible that sufficient change takes place to cause a loss of function without showing evidences of disintegration of the cells microscopically The custom of introducing iletin to the carbohydrate solutions has been adopted The blood sugar determinations taken before giving an intravenous determine the amounts of iletin This usually averages one-half that amount of iletin used for a given amount of carbohydrate that one would use in a diabetic Still considerable carbohydrate may be lost thru the urine unless that be looked for and prevented by the addition of more iletin

Chemical blood analysis is indispensable in these patients There is no other means of determining the status of the patient The temperature may go up, the pulse become imperceptible, and the wound not drain, but what can one do about it For the high temperature one can employ external cold, and force the temperature down thereby reducing the metabolism, and doing harm to the patient in that metabolism is the means of overcoming the infection One may stimulate a weakened heart muscle, but what does that do unless the heart itself is the seat of disease Everyone is familiar with the increase volume and force of the pulse after replenishing fluid and food to an impoverished circulation However, when the chemical blood analysis shows a lowering or an increase in the CO_2 combining power, one can do something definite and expect a definite response The same is true for changes in blood chlorides and blood sugar Therein lies its appeal to those who make use of it. In it we have something tangible, reasonable and fairly accurate

EDITORIAL

NEW YORK STATE JOURNAL OF MEDICINE

Published by the Medical Society of the State of New York under the auspices of the Committee on Publication

Business and Editorial Office—2 East 103rd Street, New York, N Y Telephone, Atwater 5056

The Medical Society of the State of New York is not responsible for views or statements, outside of its own authoritative actions published in the JOURNAL. Views expressed in the various departments of the JOURNAL represent the views of the writers.

WINTER ACTIVITIES

The development of literature on the practice of medicine by medical societies is progressing steadily and surely While the last issue of this Journal contained only two pages on Medical Society Practice, its meagerness was due to lack of time to write up the reports rather than to a dearth of practice, but the issue of October first contained nine pages, and this issue has seven pages of society activities

The medical societies of the counties, the districts and the state are more active than ever, and their records are developing into an extensive literature which will receive the recognition it deserves

INSURANCE AGAINST MALPRACTICE SUITS

Insurance against malpractice suits is under the same governmental supervision as are other forms of insurance Many physicians do not seem to know that before an insurance company can legally do business in New York State, it must conform to certain procedures But if a company does not conform to those procedures, anyone who insures in it cannot sue the company in New York State A bootleg company, therefore, seems to have certain advantages in New York State, while a physician insuring in such a company may have great difficulty in collecting his insurance These points were developed in an editorial by Mr Stryker in the Legal Department of this Journal of August 15, 1928, page 1004

New York is not the only State in which bootleg insurance is issued Michigan is confronted with the same problem The *Journal of the Michigan State Medical Society* of October, 1929, page 726, contains a warning from R M Wade, Second Deputy Commissioner of the Department of Insurance of the State of Michigan, in answer to an inquiry regarding a flattering offer made to Michigan physicians by an insurance company of Chicago Mr Wade wrote

"It is ridiculous for the company to offer such a charming amount for services which amount is to be predicated upon 5 per cent of the premiums collected in the congressional district where the doctor is located As a matter of fact, there will be no premiums from a congressional district in Michigan, as the company will not be authorized to transact its business within this state It might, however, be able to induce some residents of this state to insure with it through the mails However, if such is done and a doctor was appointed to the staff, the doctor would be representing a company not regularly authorized and the doctor would thereby place himself in the position of representing an unauthorized insurance company, which would be contrary to the existing statutes

"I most heartily recommend that you refuse to fall for their flattering offers, and I know, Doctor, that you will recommend to your associates in Detroit, to stay clear of this company's scheme In order that the department might apprise professional men of the state, we have given the press an article in regard to this matter It might be well for you to have your medical society warn its members against entering into this plan"

The same condition confronts the physicians of New York State The special committee of the Medical Society of the State of New York investigated the whole subject of insurance against malpractice suits, and recommended a plan of group insurance offered by the Ætna Life Insurance Company which is set forth in detail in this Journal of October 15 1928 page 1244

Physicians are urged to take indemnity insurance under the group plan offered by the Ætna Life Insurance Company through the Medical Society of the State of New York, and thereby avoid the uncertainty and dangers of insurance with bootleg companies

BALANCED PROGRAM OF A COUNTY SOCIETY

The County Medical Society is designed to help the physician to give medical service to the people, but there has been a development and broad evolution of what constitutes modern medical service which the physician is expected to give, and to whom he should give it A generation ago it was satisfactory that a doctor confined his activities to ministering to the sick and disabled who sought his services While the doctor recognized the existence of sickness in those who could not come to him or apply for his advice, yet he did not see how he could improve the sick person's social or financial condition so that he could act on the medical advice But now both the science and the art of practice of preventive medicine has been developed by both the medical profession and the people to such an extent that physicans are ready to give the advice and the people have provided the means to carry it out through departments of health, lay health organizations and industrial companies

The application of the principles of preventive medicine has been dependent on the development of the science and art of sociology There is now a science of the practice of preventive medicine by organizations of doctors, upon groups of people The Medical Profession consists of County Medical Societies, and the people are represented by organizations both official and lay A balanced program of a meeting of a County Medical Society will contain a section on the practice of medicine by the Society Note the reports of the meetings of the County Societies in this and other State Journals Their programs need strengthening and broadening along such civic lines of anti-tuberculosis work, the immunization of children against diphtheria, and the public health education of the people These and similar lines of activity should be included in the program of every County Society meeting

PRACTICAL MEDICAL WRITING

The effectiveness of medical writing depends on two factors

1 The occasion or opportunity which establishes a reason for the article

2 The form or style of the writing

This Journal has frequently quoted from a mimeographed "Health Officer's Bulletin for the District consisting of Sullivan, Ulster, Orange, and Rockland Counties"

This Bulletin is composed and issued by Dr F W Laidlaw, District State Health Officer, who is personally responsible for its contents His point of view is that of a rural physician who specializes in public health work His articles in the Bulletin are based on actual experiences, and he writes in the way and manner of a personal conversation His description of the relation of physicians to typhoid carriers, which is printed on page 1318 is an illustration of the ideals and standards set forth by the Committee on Public Relations of the Medical Society of the State of New York, and expressed by Dr George E Vincent in his address before the annual meeting of the State Society in 1925 on the subject 'Every Doctor a Health Officer"

LOOKING BACKWARD

This Journal Twenty-five Years Ago

The Journal Twenty-five years ago the New York State Medical Association had about 1800 members The total expense of publishing the Journal for the year was $2,795 73, and the receipts were $1,828 05 Concerning the Journal the President, Dr W H Thornton, said

"The point I wish most to emphasize is that it is of vital importance for a society to reach, to insist, to hold every man in its jurisdiction who is now or may become not merely an additional name on the membership list, but an active worker, one who feels he is part of a powerful association and by his membership and by his individual interest and work is himself contributing to the success of the organization You all know the importance of this, I wish to bring it to your minds and have you work upon it

"As an organization how can we help this along?

"A Journal helps this, frequent meetings of the County Societies help this, the addition of a social feature to our scientific meetings helps this, a large membership helps this, giving more power to the organization, more resources for its work A live, growing society is vastly more attractive than a weak, dying one

"A directory helps this, an accurate list of every man in the State, giving his name, his residence, his office hours, the date and place of his graduation, members and officers of all medical societies, is of much value and interest.

"Defense of members against malpractice suits helps

"Our Journal, for instance, is a powerful factor in our present success It is vastly superior to an annual volume of transactions"

President Thornton was also a man of vision, for he made the following suggestion which has not yet been put into effect generally

"Many of you are teachers in medical colleges It is incumbent upon you to instruct your students in regard to the proper relations of physicians to one another and the importance of becoming active workers in medical societies"

MEDICAL PROGRESS

A New Conception of Vaccinotherapy—M Solente states that the value of this resource is incontestable. There are, however, various drawbacks to the method—it is not always harmless but may entail severe reactions and the results are not constant nor are the technique and dosage standardized Finally, commercialism has been too rampant. The time is ripe for a new orientation and the author thinks there are none better able to effect this than MM Teissier, Reilly, and Rivalier, who have recently written several memoirs on the subject. The problem was at first beyond all theorizing, for who could explain why the introduction of more toxic material of specific nature could favorably influence an organism already contaminated with the same? Then Wright came forward with his opsonic index and for a time the mystery seemed to have been solved, but later experience showed that this explanation falls short. The doctrine of immunization cannot be invoked to explain cures, for some vaccines have cured without causing immunity Teissier and colleagues illuminated the subject by their study of chancroid Here antecedent immunization did not prevent infection with cultures of Ducrey's bacillus Survey of different forms of vaccine cures seems to show that no single mechanism can be invoked At least three have been isolated by Teissier and colleagues 1 Infections of the cerebrospinal meningitis type Here hardly any sensibilization develops and we cannot speak of any antigenic power of the vaccine Active doses provoke a shock-like reaction or at least shock would develop in a normal subject 2 Quite opposed to the preceding is the type in which sensibilization is present in excess—seen in undulant fever and chancroid Vaccine here causes a pyretogenic reaction. 3 A type between the two preceding, of which staphylococcemia is an example In mild cases there is no sensibilization, but in severe ones the latter is present In the mild type we have only simple protein therapy and in the severe with focal reactions we may disseminate the infection by overdoses—*Le Bulletin Médical*, July 27 1929

Variability of Bacteria—A Grumbach says the old disbelief in the plurality of specific bacteria has swung too far in the opposite direction This is seen particularly in the case of the pathogenic streptococci, of the paratyphus B, and congeners, etc. At the present time some bacteriologists are asserting that several of the other organisms which cause infection from tainted meat are only minus variants of the classical paratyphus B, with mutation involved at times By reason of the differences of opinion among the best authorities the author has submitted to special research paratyphoid A and B, the Breslau *B enteriditis*, the Gärtner bacillus, and *B suipestifer* The strains were obtained from clinical typhoid and paratyphoid with a few from meat, cheese, etc All possible tests were made—cultural methods, serological, etc. Some of the technique was borrowed from the methods of differentiation of pneumococci and streptococci in common use In a clinical study of a case of typhoid or paratyphoid fever, both bacteriology and the clinical course pointed to a type of mixed typhoid-paratyphoid infection with very doubtful participation of the two forms of *B enteriditis*, evidently disregarded by the author, who also regards the *Bacillus suipestifer* as wholly distinct from the others The clinical picture set up by the latter and by the two forms of *B enteriditis* infection has always in his experience set in with acute vomiting and diarrhea In rare exceptions paratyphoid fever may begin thus, too, but he has never seen true typhoid begin with the symptoms of acute meat poisoning He is therefore a pluralist as regards these intestinal pathogens and the study of streptococci has made him a pluralist also here as well He believes that pneumococci may be differentiated from the closely related enterococci and that certain differences in behavior among nearly related organisms are not sufficient to do away with their autonomy The separation must extend through a number of differential tests and not be limited to a single one, like hemolysis for example—*Schweizerische medizinische Wochenschrift*, July 20, 1929

Purification and Sterilization of Confined Air—According to R. Cambier, city people for three-fourths of their lives are compelled to breathe an interior atmosphere which is in various ways insalubrious Disregarding the accidental admixture of acutely toxic gases and troubles due to lack of oxygen and excess of carbon dioxide, there are certain volatile bodies in very minute quantities in the air which are able to cause malaise in those who breathe it Through their strongly reducing action they are able to destroy the ozone always present in pure air These substances which comprise both protein and non-protein recall the "miasms" of the ancients, and are said by Trillat to favor the proliferation of microorganisms The author intimates that these noxious substances are derived (in part at least) from animal bodies To com-

bat their presence all volatile substances must be eliminated from the air of the room and all germ life hindered, while the ozone which has been lost to the air must be restored Ventilation, both natural and forced, which has been our sole recourse in the past, is far from securing the desired end, and in any case is not properly carried out, for draughts result which are objectionable to many people Since according to Trillat these substances may be thrown out of the air by precipitating the aqueous vapor the first great step should be directed against the latter In hot, close rooms cold metal surfaces condense this vapor and to this resource may be added the absorbent power of charcoal and the use of ultraviolet rays. The author describes, but does not illustrate, a charcoal filter devised by himself to be used in connection with ordinary ventilation measures Air which has passed this filter is now further purified by an ultraviolet lamp which is intended to antagonize any residual germ life Room air thus treated will be found to contain the necessary trace of ozone Nothing is said of exhausting the air, but the plenum ventilation caused by the steady ingress into the room of the purified air probably makes this unnecessary —*Bulletin de l'Académie de Médecine,* July 2, 1929

Results of the Operative Treatment of Ascites—F P Weber and G B Bode of the German Hospital, London, refer to the hopelessness of medical treatment and repeated puncture, quickly arriving at the original operation of anastomosis, based on the suggestion of Talma, and its various modifications of which the best to date appears to be the implantation of the omentum in the posterior sheath of the rectus muscle (Mayo) At the present time one of the main lessons learned has been that an immediate result is not attainable and that puncture must go ahead until the collateral circulation has been fully established This may require some months, but it will be noted that the intervals between punctures grow progressively longer and the amounts of fluid which come away smaller Another important factor is the proper selection of cases for intervention A series of six cases is reported briefly in which the results of the omentopexy were excellent In all the patients there was hypertrophic cirrhosis Puncture finally became unnecessary, for although some ascites continued to appear the new collateral circulation carried it away spontaneously In a series of four cases, in which for some reason or other the Talma-Mayo operation could not be carried out, the patients recovered spontaneously after numerous punctures although the authors do not impute this result to the act of puncture itself In selection of material old and cachetic individuals are excluded and apparently atrophic cirrhosis is not favorable for the operation But so mild and safe is the intervention that one should not be too particular in excluding patients from the chance of profiting The cirrhoses of known cause seem better indicated than others, as the alcoholic and syphilitic, for here we have a chance to add some medical measures to surgery The authors do not attempt to explain the occasional spontaneous recoveries following puncture and certain intraperitoneal operations, and no evidence is presented which could indicate the unintentional formation of a collateral circulation—*Deutsche medizinische Wochenschrift,* July 19, 1929

Postanginous Sepsis—K. Kissling writes exhaustively on this affection, which is to many something new or at least something which is far more common than formerly, although Strümpell's Textbook of Medicine speaks of it as not uncommon Since 1925 much literature has appeared on this condition, largely on the propriety of ligating the veins in the attempt to ward off death Practically all of the recent literature is in German and there is no mention of the streptococcus sore throat occasionally seen in epidemic incidence in the United States, which also has a high mortality In the German affection there is no epidemic incidence but the author has notes of 32 cases treated in the Mannheim Hospital during the past 10 years Figures show that the disease is on the increase for no less than 12 cases were seen in 1928 while up to 1925 it was so rare as to be almost non-existent. Bacteriological finds are very little standardized, divided chiefly between the *Streptococcus putrificus* of Schottmüller and various other anaerobic organisms in the blood It is a notable error to attribute the septicopyemia to thrombophlebitis alone for this condition may be quite absent, and in one group of cases was only doubtfully present When this element can be excluded one is forced to think of propagation along the lymphatics It is suggested that the latter type is associated with a *Streptococcus hemolyticus* infection while the thrombophlebitic type is associated with anaerobic infection, this latter comprising the *Streptococcus putrificus,* but the question may not prove so simple as that In any case thrombophlebitis must predominate, for it was found in 19 cases, either at operation or at autopsy, while in 11 more there was a strong presumption of its presence Of 4 remaining but 2 were safely set down to lymphatic propagation, although in the material of others the distribution may have been different With so large a proportion of phlebitic cases is suggested the propriety of ligation of the external jugular at once without delay for microscopic study —*Münchener medizinische Wochenschrift,* July 12, 1929

Peculiar Infection from a Dog Bite—R Grilichess reports this case from the Hygienic

Institute of Zürich A boy of 8 was savagely bitten with but mild provocation by his pet dog which had to be beaten off Face, occipital region, neck, shoulders, and breast were badly lacerated The animal proved negative for rabies and the boy was merely immunized against tetanus In addition to the superficial wounds the middle ear became in some way secondarily infected and a foul discharge escaped from the meatus in association with mastoiditis which required a radical intervention The boy had no further symptoms and attention was now directed to the discharge which gave off a fetid and even feculent odor Along with other pathogenic flora the author isolated a fine gram-positive bacillus which was cultured and used in animal experiment. Its nature was unknown, but it recalled two pathogenic germs described in connection with canine pathology and also the ordinary Pfeiffer influenza organism Studied for over a year it underwent no real changes although it appeared in more than one form—in fact it was the polymorphous quality which suggested the resemblance to a number of other well known organisms Injected into guinea pigs it proved highly pathogenic, the lesions depending on the form of injection The position of the organism is as yet undetermined although certain forms can be excluded, such as the pasteurellæ and bacteria which cause hemorrhagic septicemia The closest resemblances are to the bacilli of canine septicemia, the hemoglobinophile bacillus of the dog, and, in one form, to the *Bacillus influenzæ* which is said to cause one type of canine pneumonia The hemolytic streptococcus which had been present in the original wounds was not found in the pus from the ear and was eliminated from consideration, while the unknown organism was present in the latter, apparently in pure culture—*Schweizerische medizinische Wochenschrift,* July 13, 1929

Muscular Hernia of the Leg—Hugo Ihde has collected twelve cases of muscular hernia of the anterior aspect of the leg He finds that little attention has been paid to this condition in the literature It occurs usually, as might be expected, in soldiers, railway men foresters and athletes There are two forms of muscular hernia traumatic and constitutional or distention hernia The latter is generally found in individuals with mesodermal weakness Of the author's cases four were traumatic and eight were constitutional Distention hernia gives rise to more subjective complaints because of the nervous tendency of the patients, the successive or intermittent increases in size, or because of secondary hernias in the aponeurosis close to the primary lesion Distention gaps in the fascia of the leg are not infrequent They bear a relation to muscular hernia comparable with that of wide inguinal canals to the inguinal hernia The diagnosis of muscular hernia is easy when bearing in mind that the condition is likely to occur in certain regions in the middle third of the leg, namely, the crest of the tibia, the muscular septum on the lateral side of the tibialis anticus, the intermuscular septum between the tibialis anticus and extensor digitorum communis, and a vertical line on the summit of the muscle belly on the anterior aspect of the leg In traumatic hernias the tumor disappears on contraction, but reappears on relaxation The diagnosis is important because of the possible sociomedical and medicolegal consequences involved Muscular hernia of the leg rarely requires operation Operation was performed on three of the author's twelve patients These were cases of constitutional hernia with very protracted symptoms The indications for operation are more absolute in traumatic hernia than in the constitutional type As a radical treatment Ihde recommends myelectomy with suture in stages of muscle, fascia, and skin Simple suture of the fascia is rarely sufficiently strong to prevent recurrences in or close to the seat of the hernia—*Acta Chirurgica Scandinavica, July* 23, 1929, lxv, 2-3

Tetanus Prophylaxis and Treatment.—R. Campbell discusses at great length the subject of tetanus prophylaxis in a Swiss Canton His conclusions are in part as follows Tetanus prophylaxis is a reality and one of the accomplishments of modern medicine An injection of 20 units of antitoxin should always be given as soon as possible Subcutaneous injections give as good reults as any and are safer If there is any reason to fear anaphylaxis the dose may be broken up, the first fraction to be injected into a vein, or two injections should be made, the first from the usual horse serum and the second from bovine or sheep serum There are no contraindications if these precautions are used and while some unpleasant collateral symptoms may develop, they are not to be feared Naturally the tetanus wound must receive the best care Tincture of iodine must be well applied and followed by iodoform and the wound must in certain cases be laid open and the Carrel-Dakin solution applied as in military wounds In the author's Canton the soil, while not heavily tetanogenic, shows considerable differences in different localities, but while this affects the prognosis materially, prophylaxis should never be omitted

O Bayard discusses the treatment of tetanus and finds the serum little use, for the central nervous system cannot take up antitoxin Oxygen and heat work against the toxin and it is well to place patients in oxygen

over-pressure cabinets, while the high temperature occurring in the disease should also be of value The author suggests the use of malarial blood in this connection However, he is quite silent on the subject of death by complications and on the fact that death repeatedly occurs after symptoms of tetanus have subsided He cites cases in which intercurrent pneumonia has apparently cured tetanus, but does not mention the frequency of pneumonia deaths in lockjaw patients—*Schweizerische medizinische Wochenschrift,* August 10, 1929

Digitalis Tolerance of Patients Suffering from Renal Insufficiency—The clinical impression has been prevalent that patients suffering from renal insufficiency do not tolerate digitalis well In order to test this belief Harold Feil and Leonard Steuer made observations on ten patients diagnosed as having chronic glomerular nephritis with varying degrees of renal insufficiency All of the patients were in hospital, and none had received digitalis previously while in the hospital The drug was administered in the form of the U S P tincture of known potency in doses comparable to those used in clinical practice, namely, 1 3 c c three times daily The drug was continued until electrocardiographic evidence of digitalization occurred or until clinical symptoms of intoxication were noted From 6 6 c c. to 12 c c were given before the T-wave altered In one instance 28 c c were given before change in the T-wave occurred The total amount of digitalis taken varied from 14 6 to 64 c c The tabulated data show that these ten patients with impaired renal function, from moderate to considerable degree, tolerated digitalis well The amounts of the drug necessary to alter the T-wave in the electrocardiogram were no less than cardiac patients usually require This observation was confirmed by clinical evidence as well—*American Heart Journal,* August, 1929, iv 6

Postvaccinal Encephalitis—This subject is discussed from the clinical side by H G Huber and from the experimental angle by E Gildemeister The former reports three new cases in children under 3 years of age, all first vaccinations All recovered although left with paralyses which show a tendency to recover In but one of the three did the spinal fluid contain vaccine Of the three cases two were certainly examples of post-vaccinal encephalitis while the third was open to some doubt In the first case symptoms of encephalitis set in as early as the 5th day while the spinal fluid was shown to contain vaccine virus In the second case the incubation period was 8 days and the patient was left with a total flaccid paralysis of the right arm The third patient did not develop symptoms referred to the central nervous system until the 24th day, which appears to be much too long an incubation period for post-vaccinal encephalitis, the maximum being apparently 15 days There were an angina and rhinitis previous to the nervous manifestations and the latter suggested a meningeal complication rather than an encephalitis proper Still the child was left with a right facial paresis which developed as usual on the vaccinated side of the body Professor Gildemeister, who took care of the laboratory aspect of Huber's cases together with a fourth from the practice of another colleague, obtained but one positive outcome from a serological test of the liquor, though two rabbits were inoculated on the cornea with positive results This sequence did not develop in the other three cases, but its absence may have been due to the interval, for while in the positive case the liquor was obtained on the 7th day after vaccination, in the other three the interval was from 20 to 24 days—*Deutsche medizinische Wochenschrift,* August 16, 1929

Prevention of Cancer—Prophylaxis, according to Professor O Teutschlander, is applied etiology It is usually assumed that it can be applied only to exogenous cancers in which evidences of a precancerous condition or chronic irritation are apparent and that this type of cancer is much more infrequent than the internal or endogenous type, but this the author denies, for cancer of the stomach, cervix, etc may be regarded as exogenous and he would reverse the common opinion by making the majority of cancers secondary to irritative factors The first step in prophylaxis is obvious—removal of such irritating noxae as are apparent to us, or if this be impossible rendering them innocuous Under this head come all occupational cancers, and organized prophylaxis of industrial diseases should, of course, take care of this group The second step in prophylaxis is the extirpation of all precancerous lesions, whether or not due to the chronic application of an irritant In many cases surgical removal is indicated on general principles and without any bearing on cancer Many of these affections are of congenital origin and belong under malformations, while others, like leucoplakia, are acquired as a result of sustained irritation The author does not believe that an undue susceptibility to cancer can be antagonized by diet, hygiene, or drugs, and our only hope from general prophylaxis lies in eugenics, for men and women with a history of cancer in the ascendants and collaterals should not intermarry—*Klinische Wochenschrift,* September 17, 1929

LEGAL

By LLOYD PAUL STRYKER, ESQ
Counsel Medical Society of the State of New York

THE DOCTOR'S DILEMMA

The perversity of human nature is well known to the medical profession In their professional relations with their patients, all too frequently they are met with lack of co-operation and sometimes a stubborn and wilful defiance of the reasonable orders which they have given for the patient's welfare Many times the failure on the part of the patient to follow the orders of the physician is followed by an aggravation of the illness and in some instances by death

Your counsel has handled many cases in which the patient, though living in squalid quarters, has stubbornly refused to go to a hospital We have seen numerous instances of patients in fracture cases refusing to have an X-ray taken Then, too, the patient's insistent refusal against operative interference has very often resulted fatally to the patient Perplexing indeed is the situation of a doctor who has on his hands a refractory patient who refuses to follow his reasonable orders

A striking illustration of the injustice which sometimes falls to such a doctor's lot, is found in an account of a case in England reported recently in one of the public prints in the City of New York Not all of the medical details are found in the report, but from the facts stated it seems that a woman became ill after eating ice cream and plums A doctor was called and he diagnosed her case as a possible appendicitis He had the patient under observation for a few days, when he decided that an operation was necessary He communicated this fact to the patient and stated that she should go at once to a hospital The woman refused to follow the doctor's advice, but the next day became so seriously ill that she was removed to a hospital and operated on by another physician, but died shortly after the operation The operating surgeon diagnosed her condition on admission as acute appendicitis and ventured the opinion that she might have been saved if an operation had been performed earlier A coroner's investigation was held, the coroner reporting that death came from natural causes The coroner, however, was not satisfied with merely performing the functions of his office, but added this gratuitous statement

"Mrs X said that she did not want to go to a hospital If the doctor had made up his mind to send her to the hospital it was not a question for the patient to decide, but one for the doctor, and the doctor should insist

"It is his duty to throw up the case altogether if his instructions are not carried out Unfortunately he did not insist I am satisfied that there was an error of judgment on the part of the doctor However, one cannot blame him for not diagnosing the appendicitis, because it was in an unusual position It was an honest mistake"

The person reporting the case in the newspaper is evidently, as any reasonable person would be, wholly in sympathy with the doctor and he protests very vigorously against the coroner s statement The newspaper account reads in part

"If a physician is convinced that a patient should be sent at once to a hospital as an emergency case and the patient refuses to go what should the physician do?

"It the patient dies everybody blames the physician It the patient gets well at home the physician is discredited and the patient brags for the rest of his or her life about how he or she defied and, in a sense, defeated the physician The physician seems to get it going or coming in such instances, and they occur in the history of every general practitioner as well as in the career of many specialists * * *

'Upon reading that dictum (the coroner s statement above referred to) a physician might well ask how he would fare if he did throw up the case after he advised removal to a hospital for an operation If the patient got well the physician would be even more discredited than if he had not taken that action but had continued to attend the patient It the patient died her or his family and friends would blame the doctor for not ignoring the patient's wishes and conducting the removal willy nilly"

The injustice done the physician in this case by the statement of one of his colleagues is apparent It is refreshing to find so vigorous a resentment against the coroner's action as that expressed in this article

CLAIMED FAILURE TO DISCOVER FRACTURE

The doctor was called to the home of a woman about thirty years of age He found her sitting in a chair, she stated that she had hurt her knee An examination disclosed a large swelling on the left knee, but there was no evidence of fracture The doctor, however, advised an x-ray picture, but the woman refused The doctor prescribed lead and opium dressings, ice bags and instructed her to rest the knee Two days later the defendant again saw the patient, when he strapped the knee and immobilized it He called again a few days thereafter and observed the strapping On this visit the woman told him not to come again, that she would come to his office if she needed him She did not come, but about two weeks thereafter she asked the doctor if he could have his car go for her, so that she could come to his office, to which request the doctor acceded An examination at that time disclosed that the swelling had gone down and the knee was re-strapped The doctor saw her twice in the next week On one occasion he re-strapped the knee and found the condition much improved

About a month thereafter the patient returned to the doctor's office with a noticeable limp, and stated that she fell and hurt her knee again The doctor examined the knee and found that there was a fracture of the patella He put a bandage on the knee and ordered her to go and have an x-ray taken This was done and the x-ray report showed a fracture of the patella with a three-quarter separation After the defendant had received this report he told the woman that she would have to be operated on and she stated that she did not have any money and could not go to anything but a public hospital The doctor said he would arrange for her to go to a hospital where she could be treated free He made arrangements and advised the patient accordingly He never saw or heard from her after that

Subsequently the patient sued, claiming that the defendant in his treatment failed to discover the fracture and improperly and negligently treated her so that she lost the use of the leg and was rendered a cripple

When the case appeared on the calendar, it was marked off and the plaintiff taking no steps in the matter, the complaint was subsequently dismissed and the action terminated in the doctor's favor

---

CLAIMED NEGLIGENCE IN BREAKING OF NEEDLE

In this case the doctor was charged with negligence in the breaking of a needle while treating the plaintiff for a cataract in the left eye The complaint also charged that the defendant was further negligent in using improper injections for the malady from which the plaintiff was suffering, and that the defendant neglected to remove the cataract, but merely prolonged the cure by improper treatment, as a result of which the plaintiff was compelled to undergo an operation Damages were prayed for in the sum of $25,000

Plaintiff was a man about 58 years of age Upon examination on his first visit to the doctor's office, he was found to be suffering from retina chorioiditis of the left eye The doctor asked him whether he had ever had syphilis and he replied that he had and some years before he had had an ulcer The doctor also found on examination an epitrochlea lesion in both the plaintiff's arms The doctor advised injections of strychnine in the temples, mercury bichloride in the gluteal region and sodium cacodylate in the gluteal region and also sodium iodide by mouth The patient consented to these injections Before any of them were given the doctor instructed the patient that he must remain quiet while they were being given, as to do otherwise might result in breaking the needle

On each of the occasions when the injections were given the doctor first injected strychnine in the temple and then the injections in the gluteal region, one day of mercury and the next day of sodium cacodylate Injections were given daily for about two months, when on one occasion, just as the doctor was to give an injection in the gluteal region, the plaintiff jumped and the needle broke off, about a half inch remaining in the muscle The doctor probed for the needle, but could not find it He had an x-ray picture taken, but the picture did not disclose the needle The doctor then took the patient immediately to the hospital, where another picture was taken by the physician in charge of the radiographic department This picture showed the presence of the needle and it was promptly removed The doctor continued to see the patient and dressed the wound necessitated by the removal of the needle for about eight days, when it healed up The doctor treated the patient

thereafter for about a month, but his condition was not improving The defendant noticed that a cataract had developed and he told the plaintiff that this was a complication of the retina chorioiditis and that he might possibly be relieved by operation, but the patient refused to be operated on and the doctor never saw him again

The case came to trial and at the close of the plaintiff's case, there being no evidence of negligence produced by the plaintiff, the court, on its own motion, dismissed the complaint

CLAIMED FAILURE TO REMOVE FOREIGN PARTICLES

The complaint charged that the plaintiff a woman, sustained injuries as a result of an explosion of an iron stove, and employed the defendant to treat her injuries, but that he negligently failed to remove any of the foreign particles lodged in her body, as a result of which she was compelled to undergo several operations She also contended that as a result of the defendant's negligence she has lost the entire use of one leg and was rendered permanently disabled Damages were asked for in the sum of $35,000

The defendant received a telephone call one evening to come immediately to this woman's home, the person calling informing the doctor that she had sustained severe burns as a result of an explosion of a sheet iron heating stove Stopping only to get together the necessary supplies and instruments the doctor went immediately to her home On examination he found that pieces of the sheet iron had peppered the legs and thighs of the woman The pieces were very small, the wounds being more like the wounds of a shot gun, except one large wound on the left shin The woman's home was very dirty and the doctor advised that she go to a hospital, which she refused to do The doctor, after sterlizing his instruments, applied a local application of merurochrome to the injured parts and removed all the foreign particles that could possibly be removed at this time and then dressed the wounds The woman also told the doctor that she had had trouble with her legs prior to this accident, that she had varicose veins, and generally that she had had trouble with her blood The doctor made a blood test which was returned negative

The doctor dressed the wounds at intervals of two days for about a month, the treatment consisting of removing foreign particles as they worked their way to the surface, and dressing the wounds in the same way as he did on the first visit There was a blood clot under the skin over the left shin bone which was troublesome, but under special bandaging it finally absorbed The patient told the doctor that she never wore elastic stockings for the swelling of her legs and he gave her an elastic bandage which he showed her how to apply After he had removed all the foreign particles and the wounds were healed, the doctor discharged her At no time did she make any complaint of the treatment and the doctor never saw her again

Shortly after the doctor's answer had been filed, the plaintiff's attorney, evidently realizing the lack of merit of his case consented to a voluntary discontinuance of the action, and an order to that effect was entered, thus terminating the matter in the doctor's favor

NEWS NOTES

SEVENTH DISTRICT BRANCH

The meeting of the Seventh District Branch of the Medical Society of the State of New York, which was held in the Sanatorium at Clifton Springs on Thursday, September 26, 1929, was notable for two features, (1) An attendance of over 200,—the largest of any District Branch, and (2) the practical nature of the scientific program

A morning and an afternoon session were devoted to scientific papers, while a luncheon meeting was filled with addresses by officers of the State Society

The first scientific paper was given by Dr Louis Hamman, of Johns Hopkins Hospital, Baltimore, Md, on the subject "Coronary Occlusion" Dr Hamman reviewed our knowledge of adult heart diseases and the relations of coronary occlusion to angina pectoris, fibrillation, acute dilation, and sudden death, and showed the increasing amount of cardiac knowledge that has been attained by the use of the electrocardiograph and similar instruments of precison, and by their correlation with scientific observations in the autopsy, and the laboratory, but this knowledge is largely concerned with the end results of pathological processes, yet its practical correlation with clinical observations in the early stages of heart disease may be expected in future years

The subject of "Spinal Anesthesia" was presented by Dr Frank A Kelly, of Detroit, Mich Dr Kelly illustrated his lecture with lantern slides based on an experience with one thousand cases of spinal anesthesia The doctor gave high praise to this form of anesthesia, both as to its efficiency and its safety He compared its results favorably with those obtained by tne use of ether

The subject of "The Medical Question in Compensation Administration" was to have been presented by the Commissioner of Labor, Frances Perkins, but it was given by Lawyer Zimmer of the Department Mr Zimmer reviewed the actions of many physicians whose attitude toward the department was one of criticism He particularly mentioned the frequency of charging double rates for medical service with the expectation that the doctor's bill will be cut in any event The lawyer said that there would be little occasion for dissatisfaction if doctors would follow the procedures which are necessary, and would make out their reports promptly and completely

"The present status of the treatment of arthritis at the Mayo Clinic" was presented by Dr Leonard G Rowntree, of Rochester, Minn The doctor went deeply into the pathology of the condition, but said that heat offered the most practical means of relief He also said that the direct relation of barometric pressure to arthritis had been demonstrated in the Mayo Clinic

"The surgery of tubercular lung abscess" was presented by Dr Edward W Archibald of Montreal, Canada

The attitude of the Medical Society of the State of New York toward the newer medical questions was presented by some of the officers Dr J N Vander Veer, President, spoke of the economics of the practice of medicine and the assurance that doctors can receive fees commensurate with the standards of their medical practice. Doctors who practice up-to-date scientific medicine have no difficulty in obtaining adequate fees for their services

Dr Vander Veer urged physicians to adopt the practice of making physical examinations as advocated by the State Society This procedure is now being promoted by lay organizations, but doctors have the opportunity to practice it in their private offices This practice of periodical examinations by doctors would settle many of the points of difficulty which now exist between the medical men and the voluntary lay health organizations

Dr Vander Veer especially emphasized the immense amount of investigation and promotion now being done by the officers and committeemen of the State Society He said that the record of the work is found in the State Journal, and that the record of the activities were as important as those of individual doctors practicing medicine He therefore urged doctors to read the Journal, especially its news notes and the editorial department where the record of the work and plans of the medical societies are printed

Dr John A Card, speaker of the house of delegates, called the attention of the doctors to the special value of the indemnity insurance plan which is offered by the Medical Society of the State of New York.

Dr W H Ross, President-elect, called attention to some of the newer phases of the activities of the Medical Society of the State of New York, especially the relation of the medical profession to other health organizations

SIXTH DISTRICT BRANCH

The Sixth District Branch of the Medical Society of the State of New York held its twenty-third annual meeting in Cortland, N Y on September 27, 1929, with 126 members present Morning and afternoon sessions were devoted to scientific medicine, and the State Society officers addressed the doctors in after-dinner talks, following a luncheon at the Country Club The first number on the program was a paper on "Mesenteric Vascular Occlusion" by Dr Ross G Loop, M D of Elmira The paper brought out the fact that thrombosis of a mesenteric artery was a common cause of intestinal paralysis following abdominal operations

"Kidney Anomalies" was discussed by Dr John E Wattenberg of Cortland

The "President's Address" was given by Dr La Rue Colgrove on the subject of sanitation in Palestine, illustrated with lantern slides taken by Dr Colgrove during his recent trip through the Holy Land

The subject of "Biliary Tract Infection" was discussed by Dr John B Deaver of Philadelphia

Dr Lawrason Brown of Saranac Lake spoke on the "Early Diagnosis of Pulmonary Tuberculosis for the General Practitioner"

The addresses after the noon luncheon were on the plans and ideals of the Medical Society of the State of New York Dr Vander Veer, President, spoke on the economic side of the practice of the newer forms of medicine, especially preventive medicine, and the periodic health examination Dr Vander Veer called the attention of the doctors to the economic loss to themselves from their failure to practice these forms of medicine While the amount of sickness in general was diminished, the amount of practice lost to the doctors is more than made up by the opportunities for the newer practice of preventive medicine The doctor is compelled to consider the economics of his medical practice, and if he gives the newer forms of medical service to all classes of people, he will profit financially by his practice (See pages 1359 and 1362)

Dr Vander Veer from the wealth of detail of his knowledge of medical conditions in New York State spoke of the inroads which voluntary health associations have made on the private practice of medicine He said that there was something like five hundred voluntary organizations concerned in health in New York City These organizations are creating a field for the practice of preventive medicine by physicians, just as legitimate and necessary as the practice of curative medicine by the performance of surgical operations, and if doctors neglect these fields, they are neglecting plain opportunities for practicing medicine

Dr Vander Veer suggested that county medical societies are almost compelled to consider the subject of the medical examination of school children, the attitude of the health officers, the medical service to the poor, and similar questions regarding the practice of medicine by physicians as a group in distinction from their activities as individual doctors

Dr W H Ross, President-elect, spoke on the relations of the county medical society toward those organizations which have to do with health, especially the Boards of Health and the State Charities Aid Association These relations are being worked out by the Public Relations Committee of the State Society

---

EIGHTH DISTRICT BRANCH

The twenty-fourth annual meeting of the Eighth District Branch of the Medical Society of the State of New York was held Thursday, October 3, 1929, at the Buffalo City Hospital The Eighth District Branch comprises the counties of Allegany, Cattaraugus, Chautauqua, Erie, Genesee, Niagara, Orleans and Wyoming Last year the clinics which comprised the morning session met with such general approval and were so well attended by the men in the outlying counties, that it was decided to repeat this part of the program This year the morning session began at nine o'clock with a clinico-pathological conference conducted by Wm F Jacobs, M D, pathologist at the Buffalo City Hospital The first case presented was a case of chronic pancreatitis The clinical history of this case together with the complete laboratory reports, post mortem findings, and a complete discussion of the disease from all angles by Dr Allen A Jones of Buffalo made a valuable and interesting session

From ten to eleven there were laboratory clinics covering laboratory technique, electro-cardiogram demonstrations, metabolism tests, and transfusions, all of which were attended by groups the capacity of each clinic.

From eleven to twelve, surgical and special clinics were given by members of the staff at the City Hospital and again there was demonstrated the widespread interest of the general practitioner in approved methods of medical and surgical treatment

From twelve to one, the business meeting and election of officers were held At the business meeting the Niagara County Medical Society presented a resolution which demonstrates the advisability of county societies bringing their problems of vital importance to the state society through district branch meetings This resolution will be transmitted to each county society in the district The resolution was as follows

WHEREAS, Section 77, Article IX, Chapter Forty-Two of the Public Welfare Law passed April 12, 1929, to become effective January 1, 1930 reads "It shall be the duty of Public Welfare Officials, insofar as funds are available for that purpose, to provide adequately for those unable to maintain themselves They shall, whenever possible, administer such care and treatment as may restore such person to a condition of self support, and shall further give such service to those liable to become destitute as may prevent the necessity of their becoming public charges As far as possible, families should be kept together, and they shall not be separated for reasons of poverty alone Whenever practicable, relief and service shall be given a poor person in his own home, the Commissioner may, however, in his own discretion, provide relief and care at a boarding home, the house of a relative, a public or private home or institution or in a hospital," and,

WHEREAS, Section 43, Article VI of the Public Welfare Law provides that, "It shall be the duty of the Board of Supervisors of a County, the town board of a town, and the appropriating body of a city to make adequate provision and to take such action as may be necessary to provide public relief required by the Chapter," and,

WHEREAS, Section 84, Article X of the Public Welfare Law provides that, "When a legislative body shall make an appropriation for this purpose, one or more physicians shall be appointed to care for sick persons in their homes In a county public welfare district, such physician shall be appointed by the county commissioner In a city such physician or physicians shall be appointed in accordance with the local or general law relating to the city In a town, such physician shall be appointed by the town board. Where no physician is so appointed, the public welfare official shall employ a physician or physicians to visit sick persons in their homes whenever necessary," and,

WHEREAS, the above sections of the Law, by including "those liable to become destitute with "those unable to maintain themselves" will afford medical relief to a large additional number of persons, and,

WHEREAS, present methods of providing medical relief for such persons by sending them to the DOCTOR FOR THE POOR or of having such an official call on them in home or hospital, is an antiquated custom which lays a stigma on those receiving its supposed benefits and thus prevents the needy from applying for medical relief, and,

WHEREAS, such methods are not "consistent with a well-founded and rapidly developing sentiment among welfare workers that the family physician and family surroundings," to quote Dr Joseph S Lawrence, Executive Officer of the Medical Society of the State of New York, "are more conductive to the restoration of health than any other arrangements, no matter how well they may be planned," and,

WHEREAS, Section 84, Article X of the Public Welfare Law clearly permits the Public Welfare Officers to interpret and administer the Law in a manner as to designate the patient's family physician or physician of his choice as the responsible active attending physician in each case of those unable to maintain themselves or liable to become destitute requiring medical or surgical care.

THEREFORE BE IT RESOLVED, That the Eighth District Branch of the Medical Society of the State of New York at this regular meeting on October 3, 1929 favor the designation of the family physician or physician of the patient's choicce, rather than especially appointed salaried physicians, as the proper responsible active attending physician in each and every instance of "those unable to maintain themselves" or of "those liable to become a public charge requiring medical or surgical care," and,

BE IT FURTHER RESOLVED, That this resolution be transmitted to the Medical Society of the State of New York for its endorsement and support, and that the Welfare Officials, Boards of Supervisors, and those responsible for the assignment of these cases be memoralized to take cognizance of these resolutions

After a spirited discussion the resolution was carried

Dr James N Vander Veer, President of the State Society, addressed the meeting and discussed the many activities which the society is now carrying on, and urged a greater interest of county societies in their district branch meetings

Dr Wm H Ross, President-elect, discussed the work of the Public Relations Committee

Dr John A Card, Speaker of the House of Delegates, made an urgent plea for more members to take their insurance in the Company approved by the State Medical Society instead of the bootleg insurance companies which make promises that they cannot fulfill

After a cafeteria luncheon served in the hospital, the afternoon session was resumed at 2 15 o'clock The first paper was entitled "Changes in Medical Economics During the Past Twenty Years," by Dr W Warren Britt, which was discussed by Doctors Vander Veer, Ross and Card

The second paper of the afternoon was "Some Recent Laboratory Research on Gastric Cases," by Dr Geo H Crile of Cleveland Dr Crile gave a preliminary survey on some very interesting work which is being carried on at his laboratory, but which has not progressed far enough to warrant final conclusions

The new officers elected were, Presidnt, W Ross Thompson, M D, Warsaw, First Vice-President, Raymond B Morris, M D, Olean, Second Vice-President, Frederick J Schnell, M D, North Tonawanda, Secretary, W Warren Britt, M D, Tonawanda, Treasurer, Fitch H Van Orsdale, M D, Belmont

The auditorium was filled to capacity and the comments of many were that it was the best district branch meeting they had ever attended

W WARREN BRITT, M D, *Secretary*

FIFTH DISTRICT BRANCH

The Fifth District Branch of the Medical Society of the State of New York, comprising the counties of Herkimer, Jefferson, Lewis, Madison, Oneida, Onondaga, and Oswego, held its twenty-third annual meeting in Watertown on Thursday, October 17, 1929, in the Y M C A building This District, following the plan of the Sixth and Seventh Districts, held a scientific session in the morning and afternoon with speaking by the State officers after luncheon which was held at the Black River Valley Club

The "Treatment of Uterine Prolapse" was discussed by Dr George B Broad of Syracuse

"One Year's Experience in Neurological Surgery in a General Surgical Clinic" was presented by Dr W P Van Wagenen of Rochester

"Common Disabilities of the Feet Diagnosis and Treatment" were described by Dr Armitage Whitman of New York

A paper on "The Golden Age in Public Health Work" was given by Dr William C Groat, of Syracuse, in which he described the work being done by the Syracuse Department of Health

"The Hypersensitive Heart" was discussed by Dr James P O'Hare of Boston, Mass

Dr Vander Veer, President of the State Society emphasized the many activities of the Medical Society of the State of New York and showed how they concerned the welfare of every physician in the State as well as being for the benefit of the people The only justification of medical service is public benefit, and yet medical economics must be considered by every physician The County Medical Society affords the physician the opportunity to discharge his civic duties in ways which are set forth frequently in articles in the State Journal

Dr Vander Veer urged the members to read the Journal for the sake of ascertaining the attitude of the leaders of the medical profession in regard to these newer forms of the practice of medicine, and especially in regard to the duties of county societies as groups of doctors in distinction from the actions of individual doctors The State Journal is published for the purpose of informing physicians about those forms of medical practice which belong to the medical societies of the counties and of the state A doctor cannot discharge his civic duties except as he acts with his confreres in the group called county society, which is the official, concrete expression of the more vague idea of the medical profession If doctors would read their Journal they would find how medical societies are practicing preventive medicine and will get ideas for conducting their own county societies

Dr John A Card, Speaker of the House of Delegates, urged the physicians to adopt the indemnity insurance offered through the Medical Society of the State of New York

---

KINGS COUNTY

The Medical Society of the County of Kings held its first stated meeting of the autumn season Tuesday evening, October 15, in the Medical Society Building with about 175 members in attendance

The evening was practically devoted to addresses by Malcolm L Harris, M D , F A C S the President of the American Medical Association, whose address was on "The Trend of Medicine and the Cost of Being Sick" and Edward C Streeter, M D , Professor of Medical History, Harvard University, who spoke on "Leonardo Da Vinci and the Practice of Dissection Among the Florentine Artists"

In connection with Dr Streeter s address the Library had in the Reading Room on the evening of the meeting an exhibition of some of Da Vinci's works, and other early anatomical publications from its collection

Dr Harris discussed expenses "incurred" upon people when they are ill, using that word especially to show that expense is brought on them by themselves His investigations into the real necessity for medical service, the people's ability adequately to pay for it, and the facilities for dispensing such service, revealed some interesting points pertinent to medical economics

The middle class, he pointed out, are complaining although they are working shorter hours and earning more than ever before They are excusing their activities with the old political slogan, "The Luxuries of Yesterday are the Necessities of Today!" They are urged on all sides by high pressure salesmanship to buy what they do not need on the installment plan They are to be censured severely for defaulting their medical bills and continuing such purchases

Hospitals he said, are in the wrong neighborhood if they fail to be self-sutaining and do not justify their existence there Attending doctors can often cut down on bills which patients are allowed to run up in hospitals Too

frequent *x*-ray pictures, too prolonged private nursing care, failure to have convalescence completed at home, are all factors in swelling the bills of individuals confined in hospitals He decried the tendency of poorer patients who demand the care of specialists in 80% of which cases their family doctor would adequately suffice

Back in the fifteenth century the Italo-Byzantine art depicted human beings in long formless robes, showing only faces in detail, angels being a favorite character Dr Streeter traced the trend of art through that century, pointing out the contributions to anatomy from a new group of investigators—the artists, using methods which were not duplicated until our generation

The change from the richly decorative but flat mosaics of Byzantine art to an appreciation of surface anatomy noting depth in space began with Giotto He tried to give the Bourgeoisie some life-like figures in actions which they liked Stephano and Donatello improved this tendency, in fact Donatello showed knowledge of anatomy in "The Miser's Heart" which showed a complete dissecting room scene. Pollaiuolo was the first Italian artist to dissect in order to study muscles when set in motion He liked to show struggling figures with bulging muscles

School anatomies failed to show artists the mechanism of muscles in movement Public anatomies were confused affairs, so artists held post mortems sub rosa and through dissection in this manner Da Vinci was able to outstrip Vesalius in analyzing motion

Leonardo Da Vinci introduced new anatomical methods such as serial sections of the eye, and wax casts of the ventricles of the brain In his studies on the heart, he all but discovered the circulation of the blood

D E O

MEDICAL INFORMATION BUREAU

The need of an authoritative source of medical information for newspapers and the general public has been felt by the leading medical societies of Greater New York This Journal of November 15, 1928, page 1377, recorded the formation of a Medical Information Bureau under the joint auspices of the Medical Society of the County of New York, and the New York Academy of Medicine The Secretary of the Bureau, Dr Iago Galston, has submitted the following report—*Editor's Note*

A survey of the statistical summary of the Bureau's activities from November 5, 1928, to September 1, 1929, reveals the following figures

Letters received	742
Letters issued	1,085
Telephone calls made	1,202
Personal interviews granted	129

These figures, however, offer only a most inadequate picture of the services which the Bureau has been called upon to render To appreciate what the figures really represent, it is necessary to know a few of the typical written, telephone or personal inquiries addressed to the Bureau by newspapers

What is the extent and the nature of quackery common in the Negro sections of Harlem?

A doctor in England claims that many women have their middle toes removed so that they might wear fashionable shoes Is that statement correct?

Who are the "medical martyrs," and in the pursuit of what diseases did they lose their lives?

What is the bacteriophage?

What is the merit of the so-called lime cure for tuberculosis?

What is the merit of indigo in the treatment of septic infections?

How are the $200,000,000 contributed for medical research spent?

What is spinal anesthesia?

What is the status of anti-tuberculosis vaccine?

What gases caused the deaths in the Cleveland Clinic fire?

What are the effects of sunburn?

What is kala-azar?

What is the value of medical advertising testimonials?

What is the worth of the eighteen-day reducing diet?

Can "stunt flying" cure deafness?

From individuals the Bureau received equally diverse inquiries In the answering of a large number of these, time and labor-consuming personal interviews were required By mail inquiries have reached us from all parts of the world

A person in Binghampton inquired how the paternity of children can be established through blood examinations

Another asked as to the legality of sterilization in the State of New York

From Athens, Greece, came an inquiry on the use of iodized oil in the treatment of sinus infection

A physician inquired where he could buy a quantity of radium

Inquiries were received as to sanatoria for nervous cases, the legal aspects of gold pessary, cures for epilepsy, cures for paralysis agitans

From Doctor Maxim Bing, of Berlin, came an inquiry on American contributions to the study of the detoxicating function of the liver

A physician, whose four brothers were stricken, inquired for the latest treatment of trichinosis

A number of organizations (commercial and philanthropic) have made use of the Bureau's services Outstanding amongst these was the National Better Business Bureau The Better Business Bureau has been assisted by the Medical Information Bureau in formulating and issuing bulletins warning of the operations of a number of quack institutions and the like Bulletins have been issued on the Peterson Institute, on deafness, catarrh and cancer cures, on the Lesser Slim-Figure Bath, on obesity cures, on the Anita Institute for Reshaping the Human Nose, on the Vibraphone, on Therenoid, and on a number of other quack and dishonest medical advertisements

Several of the larger advertising companies (principal among them N W Ayer & Son, Batten, Barton, Durstine & Osborn), have used the Bureau in censoring their medical advertising material It is of interest to note here that two of these advertising agencies expressed themselves willing to pay for the services received

The "Times" newspaper, in numerous instances, consulted the Bureau with reference to medical advertising matter submitted to them The National Broadcasting Company has also sought the advice of the Bureau in the control of their medical programs

The Medical Information Bureau, however, has not been passive in its operations, but has sought to actively promote the ends for which it was organized Thus, for example, it arranged for the interviewing by representatives of the leading New York newspapers of the President-elect Doctor DeWitt Stetten—thus enabling him to present to the public the problems which organized medicine is facing and the manner in which it is intended to deal with them

A report on medical progress during 1929 was issued by the Bureau, and was extensively published throughout the country

Numerous services were rendered to feature writers interested in presenting to the public certain facts of a medical nature

Releases were issued by the Bureau with reference to the Anti-vivisection campaign, on a so-called case of kala-azar, on the abuses of the ultra-violet, and other items

The Bureau has also been vigilant in its opposition to medical quackery, particularly in the newspapers In the main the cooperation given the Bureau by public and commercial agencies has been gratifying The Bureau's releases were published and editorial mention made of the Bureau in practically all of New York's leading journals

The experience of the ten months has pointed out certain desirable extensions in the Bureau's functions In a number of the specialties (principally medicine, dermatology, neurology, physiotherapy and psychiatry) the number of consultants should be increased so that too much of a burden need not be imposed upon those now serving

The Bureau ought also to be in a position to issue more releases to the press During the summer months, particularly, there appears to be a large demand for scientific and medical news The newspapers are more willing to accept such material at that time than during the rest of the year More of the routine activities of the New York Academy of Medicine and the Medical Society of the County of New York should be reported to the public

A more strenuous effort should be made to secure the cooperation of newspapers and radio stations in the combat of quack advertising While the newspapers do cooperate with the Bureau on the news side of their business, they are not as receptive to the Bureau's suggestions when it affects their advertising The same, to an extent, is true of the radio station This, we are led to believe, is not chargeable to the indifference of responsible persons to the welfare of the community, but rather to their ignorance of the importance of the matter

In conclusion it should be noted that the Bureau's activities have mounted constantly, and that we may expect to grow much beyond our present proportions

SPECIAL COMMITTEE ON PERIODIC HEALTH EXAMINATIONS

An organization meeting of the Special Committee on Periodic Examinations was held in Saratoga Springs on the afternoon of September 20, 1929, immediately after the meeting of the Fourth District Branch The following members of the Committee were present Dr C Ward Crampton, Chairman, Dr W W Britt, of Tonawanda, Dr C C Trembley, of Saranac Lake, and Dr Luzerne Coville, of Ithaca. There were also present by invitation, Dr J N Van der Veer, President of the State Medical Society, Dr William H Ross, President-elect, Dr Daniel S Dougherty, Secretary, Dr James E Sadlier, Chairman of the Committee on Public Relations, Dr Thomas P Farmer, Chairman of the Committee on Public Health and Medical Education, Dr Frank Overton, Executive Editor of the NEW YORK STATE JOURNAL OF MEDICINE

The Chairman's program of action was considered, item by item As questions of policy arose, they were discussed by officers of the State and suggestions given and accepted It was decided to present this program to the Committee on Publication for printing in the Journal for the information of the members of the State Society

The more important matters decided were as follows

The President of each County Society should be requested to name a representative of his society on this subject

Dr T P Farmer offered the cooperation of the Committee on Public Health and Medical Education inviting the Committee to present and submit a plan for post-graduate instruction of physicians on Health Examinations, and offered to contact with the representatives of his Committee in all County Societies

The cooperation of the Committee on Publication was offered respectively by Dr Sadlier and Dr Ross and accepted with appreciation

The Chairman reported his request for funds and his conference with Dr Matthias Nicoll, State Commissioner of Health and Governor Milliken of the Motion Picture Producers Association of the United States, who promised their cooperation He also reported the progress of the New York County Health Examination Campaign

The Committee thereupon moved to request the New York County Society to make such record of its acts and methods as would aid in the preparation of a standard method of conducting such campaigns by County Societies

There was a general discussion as to the kind of aid from outside sources which could be accepted by the Committee

The Fact-Gathering Campaign was agreed upon as the initial work of the Committee, not, however, to delay the preparation of its other work Facts are required, first with reference to the examinee, and secondly with reference to the examination As to the examinees, it was recognized that citizens of the State vary as to sex, age, physiological age, marital status, occupation, etc It was agreed to divide this field among the members of the Committee, whereupon Dr Britt was assigned to Industry, Dr Trembley to Children, and Dr Coville to the Farmer and Agricultural conditions

A second classification relates to the examination and its medical aspects, the different parts of the body, systems, functions, symptoms, and diseases, with particular reference to pre-clinical signs It was agreed to assign as many as possible of these topics to members of the Committee whereupon Dr Britt was assigned to the Circulation, and Dr Trembley to Tuberculosis

It was suggested that an opportunity should be given to members of the State Society not members of the Committee to take and work upon assignments of this nature, assignment to a section of the field, for example, industry, farmers, religious organizations, social organizations involving the following outline for Sub-Committee Studies on Examinee Groups

1 Census report of population of group
2 Name and description of organizations affecting citizens in this group, the nature of their jurisdiction, contact, or interest
3 The main function of these organizations if not primarily health
4 A statement of their purpose
5 A statement of their methods
6 A statment of their results
7 What can reasonably be expected of these organizations
8 What is proposed for immediate action
9 What should be accomplished by May, 1930
10 What should be accomplished by May, 1931
11 What should be accomplished by May, 1940
12 Liaison officers and methods

With reference to the second series of assignments, i e, regions of the body, symptoms, diseases, etc, it was determined to lay down a general basic method of attack providing for the collection of data and research in pre-clinical signs C Ward CRAMPTON *Chairman*

THE DAILY PRESS

INSTALLMENT DOCTORING

The New York *Sun* of September 27 comments editorially on a plan of paying for medical service on the installment plan

"A corporation has been chartered in California to apply the principle of installment buying to medical and dental service If a man or woman requires treatment of the teeth, if an operation seems desirable, the finance company will take care of the charges under contract for repayment over a period of time. The success of such an arrangement would depend in large measure on maintenance of proper ethical standards by the physicians, surgeons and dentists affected

"On a small scale, dental work has been put on an installment basis by at least one organization in New York, but there has been no attempt here to finance all varieties of medical and dental service.

"There are thousands and hundreds of thousands of men and women who, merely because they have not in hand the fee required, neglect their bodies when surgical attention is indicated, passing through various phases of infirmity from slight inconvenience perhaps to complete incapacity They destroy their own chance of happiness, impair their usefulness, burden their families and friends If their needs could be attended to early under a system of financing fair to borrower and to lender they would profit greatly, and so might the community"

The New York *Sun* of October 2 prints a letter written by the Executive Secretary of the American Association for old age security in criticism of the plan, but in place of it he proposes state medicine as follows

"In practically every industrial nation on earth the problem has been solved intelligently and constructively through a system of compulsory insurance conducted by the Government, which distributes the burden of illness upon the entire community Everywhere this plan has been found a most workable and feasible one. Why shall we do the wrong thing when it is so much easier to do the right thing?

"Some ten years ago the California Social Insurance Commission made a study of the entire question Had California paid attention to its recommendations that sickness should be made a social burden through a system of health insurance it would not have to be faced with corporations which will unquestionably come to plague it, as they will probably soon come to curse other states There is only one way of solving the problem intelligently and that is through a system of health insurance, such as is now in operation everywhere."

Here is evidence frequently voiced by medical speakers, that state medicine is being promoted through propaganda put forth by persons paid by endowed organizations of a social nature.

SPECTATORITIS

A century and a quarter ago political economists said that burglary and selfishness would cease as soon as a man's daily wages would ensure him food, clothing, and shelter A hundred years later Steinmetz said that electricity by doing most of the world's work, would release nearly everybody to nearly boundless leisure which would be devoted to the higher forms of study and expression An editorial writer of the New York *Herald Tribune* of October 3 says

"The machine age, however, has already supplied an unexampled wealth of leisure, and what happens? Very much what Dr Jay B Nash has said to the recreation conference, that the average man with time on his hands turns out to be a spectator, 'a watcher of somebody else doing something, merely because that is the easiest thing' This occupation goes by the name of spectatoritis, a blanket description to cover all kinds of receptive amusement to escape boredom

"The observers of spectatoritis have gone little farther than to determine that the complaint is epidemic and that it is enervating The cure is not simple As Dr Nash says, 'it will take infinitely more planning than has yet been displayed by any city in the country to provide man with the activities which will make his leisure time an asset rather than a liability' And granting that these ideal activities should be scientifically provided, the individual would still be free to take them or leave them Spectatoritis is one more bug that civilization has manufactured to its own peril and worry"

GRADING ANNOYANCES

What annoys one person may please another Professor Hulsey Cason of the University of Rochester, has made a scientific study of thousands of persons to find what procedures and objects were particularly annoying to them The results are summarized in the *New York Times* of September 6, in reporting the proceedings of the International Congress of Psychology in New Haven, before which the Professor gave his report, and listed 501 serious annoyances He established a scale for recording the intensity of the annoyances, in which thirty was the maximum

The *Times* says

"Here are some of the annoyances the professor listed, together with an index number to the potency of their power to peeve

"A gushing manner, 18
Arguing, 23
Continually criticizing something, 23
Young person showing disrespect for older person, 26
Salesman trying to make sale, 23
A person crowding in front of me instead of waiting in line, 24
Talk of one's illnesses, 20
To see an intoxicated man, 22.
To see an intoxicated woman, 26.
Musicians making unnecessary movements while performing, 17
Hearing jazz, 6
Hearing mechanical music, 7
To hear poor singing, 17
To hear vocal practice, 11
Whistling to one's self, 3
Another person talking during motion picture performances, 18
A person looking over my shoulder at book or magazine I am reading, 14
To hear a man swear, 17
To hear a woman swear, 24
To see the bald head of a man, 2
To see or hear an animal treated cruelly by a person, 28.
To hear a mosquito near me when trying to sleep, 26.
To see or hear a child harshly treated by an old person, 28.
A dirty bed, 28
Flies, 25
Cockroaches, 24
Mice, 20
Sight of a snake, 17
To find dirt in food I am eating, 25
To find hair in food I am eating, 26
To smell liquor on breath of a person, 23"

DIAGNOSIS BY EXCLUSION

James J Montague in his department of "More Truth Than Poetry," in the New York *Herald Tribune,* often expresses medical truths in the form of humorous verse His plight described on October 2 will appeal to doctors of the more conservative group

"When I first fell a victim to soul-racking ills
I consulted a learned M D,
Expecting he'd give me such powders and pills
As would make a well man out of me
But, instead, he declared I should never regain
The health I enjoyed in my youth
Or return to my job with a smooth-working brain
Till I parted with every last tooth

When my teeth were extracted I still was distressed
With a highly imperfect digestion,
My slumber was never productive of rest,
And working was out of the question
I went to a doctor, who counted my pulse
And observed that I *might* be improved,
Though he couldn't assure beneficial results,
If I had both my tonsils removed

But after my teeth and my tonsils were gone
I still was not hearty nor hale,
A listless existence I daily dragged on,
Yet I grew more anemic and pale,
So I went to another great medical man,
Who remarked that, beyond any doubt,
I should live all the years of the scriptural span
If I had my appendix cut out

I did as he bade me, yet still I'm inclined
All onerous labor to shirk
In vain I endeavor to fasten my mind
On subjects that savor of work,
And yet I'm a little bit better, I own,
And perhaps, though you never can tell,
That after they've whittled me down to the bone
I'll be perfectly hearty and well"

BOOK REVIEWS

PROGRESSIVE RELAXATION A Physiological and Clinical Investigation of Muscular States and Their Significance in Psychology and Medical Practice. By EDMUND JACOBSON, A.M., Ph.D., M.D. Octavo of 429 pages, illustrated. Chicago, The University of Chicago Press, 1929. Cloth, $5.00

This volume draws attention to the problems of the study of the nervous element appearing in many diseases and a method of approach to the problems of fatigue, debility and lowered resistance in patients suffering from nervous hypertension. Nervous or neuro-muscular hypertension is defined as a condition marked by reflex phenomena of hyperexcitation and hyperirritation. The causes are varied, as emotional disturbances, agents reducing the vigor of the organism, pain and distress from whatever source and acute and chronic infections. After discussing what is ordinarily meant by the term neurasthenia, it is suggested that neuromuscular hypertension should largely replace this.

The general features of a conception of progressive relaxation are described and a technic for bringing this about is given in detail. The patient is trained to localize tensions when they occur during nervous irritability and excitement and to relax them away.

A connection is found to exist between "the muscular states, the proprioceptive sensory impulses and the conscious processes of the individual, apparently yielding to us a particularly intimate and detailed insight into matters concerning the relation of the mind and the body."

The author's conceptions are based upon much scientific and painstaking work. Their practical value will need to be determined. W. E. McCOLLOM

FURTHER STUDIES UPON CHRONIC EPIDEMIC ENCEPHALITIS. Edited by AUGUST WIMMER, M.D. Octavo of 174 pages, illustrated. London, William Heinemann, Ltd., Copenhagen, Levin & Munksgaard, 1929. Paper, 13/ net.

This monograph comprises three contributions from the psychiatric university laboratory and from the clinic for nervous and mental diseases of Copenhagen. The author is an internationally known neuropsychiatrist who enjoys a well merited position of eminence in the field of neuropsychiatry. The first paper, published in French, covers the amyotrophic disorders caused by epidemic encephalitis. The second paper, published in English, deals with the subject of epilepsy caused by chronic epidemic encephalitis. The last paper written in German, deals with the psychotic reactions in chronic epidemic encephalitis. The monograph is well written and highly stimulating. It should receive a warm welcome from those interested in epidemic encephalitis.

IRVING J. SANDS

THE TONSILS AND ADENOIDS AND THEIR DISEASES. Including the Part They Play in Systematic Diseases. By IRWIN MOORE, M.B., C.M. (Edin.) Octavo of 395 pages, illustrated. St. Louis, The C. V. Mosby Company, 1928. Cloth, $6.50.

This volume of 395 pages and more than 100 illustrations is written by one whose interest in the subject of the tonsil and adenoid is well known. As a result of the many years of serious thought which the author has given to his subject he has produced not only a masterly exposition of his subject but also an up to date reference work for those who may be interested.

Each chapter is so well written and so complete that little is to be desired. The destruction of the tonsil by chemical means through the use of the author's London paste is of interest and offers another means for treating readily accessible tonsils in patients who may be poor risks, for one reason or another.

A book such as this should pass through many later editions. It is therefore hoped that such minor omissions or commissions of error as the following will be taken care of in the next edition. The advocacy of the use of 4% cocain solution with adrenalin for injection purposes (p. 151) will not be met with favor in this country after the painstaking study of the toxic effects of local anesthetics by Emil Mayer and his committee. This committee condemned the use of cocain in local anesthesia tonsillectomy. Much of the special work that has been done in this country which touches upon pulmonary complications of tonsillectomy has been overlooked. The important contribution of Mosher which eliminated the bugaboo of the thymus gland should also be mentioned.

These are *however, minor,* when one considers the very many references and the completeness of the scope of the book. M. C. M.

MEDICAL INFORMATION IN SICKNESS AND HEALTH. By PHILIP SKRAINKA, M.D. Octavo of 577 pages. New York, Coward-McCann, Inc., 1929.

The author, in his preface, writes "the thought uppermost in my mind was to bring doctor and patient closer together in a spirit of amity, in a spirit of understandingness." This book on the human body and health is written in the endeavor to present to the laity the fundamental facts in relation to disease. It is well written, accurate and presents much of interest. The first four chapters treat of the human body and tell of the necessity for food and care of this complicated machine.

Communicable diseases are presented under five headings, depending upon the mode of transmission:

(1) Diseases spread by discharges from the nose and mouth,
(2) by the human excrement,
(3) by insects,
(4) by direct contact,
(5) by infected wounds.

This is an excellent method of presentation.

Following this the commoner diseased conditions of the various systems are given clearly and concisely with historical references to the history of these diseases. Many of the commoner minor conditions are described. The author has presented a difficult subject in a satisfactory and accurate manner and much benefit can be obtained by the laity by a study of this book. Typographically the presentation is excellent. The print is large and clear upon good paper. HENRY M. MOSES

AIDS TO MEDICINE. By JAMES L. LIVINGSTONE, M.D., Lond., M.R.C.P., Lond. Fourth Edition. 12mo of 414 pages. New York, William Wood & Company, 1929. Cloth, $1.75.

This small volume of more than 400 pages is primarily intended as a reference and review book for medical students. It is not intended to take the place of the larger volumes on medicine but is to be used in conjunction with them. The author has carefully written the work and introduced the newer aspects of medicine in this revision. The book is all-inclusive of the subject and has been clearly presented without useless words. The topics are divided into infectious diseases of known etiology, infectious diseases of unknown or doubtful etiology, animal parasites, diseases due to physical agents and intoxications, diseases of metabolism, deficiency diseases, then the diseases of the various systems of the body. This is an excellent handy reference book in medicine. HENRY M. MOSES

SURGICAL CLINICS OF NORTH AMERICA. Vol. 8, No 6 December, 1928. (Pacific Coast Surgical Association Number) Index Number Published every other month by the W B Saunders Company, Philadelphia and London. Per Clinic Year (6 issues), cloth, $16 00 net, paper, $12 00 net.

This issue is dedicated to the memory of the great anatomist and surgeon, John Hunter The surgeons of the Pacific Coast have contributed a large number of good articles on a variety of subjects to bring this volume up to the usual high standard. The selection of articles shows good judgment on the part of the Editors, so that both practitioner and specialist will benefit by the material presented

GEO. WEBB

SURGICAL CLINICS OF NORTH AMERICA. Vol 9, No 1 February, 1929 (Mayo Clinic Number) Published every other month by the W B Saunders Company Philadelphia and London. Per Clinic Year (6 issues) Cloth, $16 00 net, paper, $12.00 net

This issue needs no recommendation. It comes from the Mayo Clinic. A great variety of subjects are discussed in the characteristic Mayo clinic fashion Only the most reliable and tested methods are recommended. Considerations and theories that have proved their value in the huge turnover of the clinic have found their way into this volume. The illustrations are numerous and very instructive.

GEO WEBB

INTERNATIONAL CLINICS Edited by HENRY W CATTELL, A.M., M D Thirty-ninth Series, Volume 1 Octavo of 303 pages, illustrated. Philadelphia and London, J B Lippincott Company, 1929

We are treated to three excellent articles by Lewellys F Barker in this issue of the International Clinics The bacteriophage receives attention from the famous d'Herelle. Poliomyelitis is elucidated by Flexner Roberts writes a good paper on pellagra. The progress of medicine during 1928 is set forth by Coupal On the whole one of the best issues of this standard publication.

A. C. J

A HANDBOOK ON DIABETES. By BYRON D BOWEN, M D 12mo of 89 pages. Buffalo, The Hammond Press, 1928

This is another book written for the diabetic patient explaining the principles of the disease and general rules for treatment. It contains a chapter on general hygiene which is quite full, especially with regard to circulatory disturbances The chapter on "how to give insulin to yourself" is well illustrated and should be of considerable help to a patient. Food tables, methods of figuring a diabetic diet and recipes conclude the book.

W E. McCOLLOM

RECENT ADVANCES IN DISEASES OF CHILDREN By WILFRED J PEARSON, D S O, M.C., and W G WYLLIES, M D 12mo of 593 pages, illustrated Philadelphia, P Blakiston's Son & Company, 1928 Cloth, $3 50

This is one of a series of books on recent advances in the different departments of medicine. The preface distinctly states that this book is not intended to compete in any way with existing text books on the subject. The prime notion of the authors is to formulate principles for solving the problems of disease rather than merely to collect and record the work of others The small compass of the book naturally prevents a full discussion of any one subject. Its main value is for the general practitioner desirous of brushing up on recent developments in Pediatrics References to literature are necessarily limited by the condensed form of the text

It would not seem to the casual reader that this book possesses any great advantage over others of a similar type that have appeared within the last year or so

WM HENRY DONNELLY

TEXTBOOK OF CLINICAL NEUROLOGY For Students and Practitioners By M NEUSTAEDTER, M D Octavo of 602 pages, illustrated. Philadelphia, F A Davis Company, 1929 Cloth, $6 00

As we read the book, we appreciate that the author is drawing upon the data accumulated from his large personal experience A book is the sum total of a writer's experience, or it should be, and not simply a summary of the literature although the latter is essential in a well rounded work. The author has definitely set out with this object in view and this impression is created as the book is read.

The reviewer agrees that the matter is presented briefly and to a great extent clearly, although he feels that the author has sacrificed clearness for brevity at times. He is often dogmatic in his statements when there is no real occasion to be so

The general makeup of the book, the quality of the paper, and the size of the type create a feeling of satisfaction. A valuable feature of the work is the unusually large number of illustrations both of clinical cases and of pathologic specimens This is one of the outstanding points and should have a very strong appeal to the student. The author is to be congratulated because of his attention to the details of therapy The neurologist is often criticised for his therapeutic failures, but one will find many helpful suggestions for treatment in this work, which may lighten the severity of the criticism.

The book is well worth adding to one's library It will not appeal to the specialist as much as it will to those for whom it was written, the medical student and the general practitioner

HAROLD R. MERWARTH.

I HUMAN CONSTITUTION Its Significance in Medicine and How it May Be Studied II The Influence of Sex in Determining Human Disease Potentiality III The Patient and His Physician By GEORGE DRAPER, M D Octavo of 75 pages, illustrated. Baltimore, The Williams & Wilkins Company, 1928 (The Beaumont Foundation Lectures—Series No 7)

The average physician, when he thinks of a disease, is especially concerned with the exciting agent of that disease He is interested in the typhoid bacillus, the meningococcus, the spirochaeta pallida With the special peculiarities of the individual attacked by these germs, he has but little or no concern In fact, most physicians know very little about the different types of man with their various resistances and susceptibilities towards disease. This, however, is what engages the attention of Draper To the study of it he has devoted many years He is interested not only in the fact that John Jones and William Adams are suffering from meningococcus meningitis, but he looks at these men, notes their build or constitution, and knows, as a result of this inspection, that though both are suffering from the same disease, one, having a certain body configuration, will probably die of the meningitis, whereas, the other, with a different body configuration, will, although as sick to-day as his fellow sufferer, probably recover

Most of us know a little about a typus phthisicus and a typus apoplecticus Draper knows a great deal more about the types and constitutions of men, and gives us a little of his knowledge in these three lectures The reviewer highly recommends this book to physicians, since in it the author, in a beautiful philosophical way presents an aspect of the battle between man and sickness on which most physicians but seldom meditate

ISRAEL H MARCUS

OESOPHAGEAL OBSTRUCTION ITS PATHOLOGY, DIAGNOSIS AND TREATMENT [Based on the Jacksonian Prize Essay of the Royal College of Surgeons of the England for 1924 (Published by Permission of the Council) and Including a Hunterian Lecture Delivered at the Royal College of Surgeons in 1926] By A. LAWRENCE ABEL, M.S (Lond.), F.R.C.S (Eng) Quarto of 234 pages, illustrated. New York. Oxford University Press, 1929

This is undoubtedly one of the most valuable contributions to the subject which has appeared The author has been most painstaking in his early chapters on anatomy, physiology, pathology and general diagnosis and treatment and his method of introducing practical clinical points in these chapters, make them much more interesting reading than is usual for such descriptive matter As practically all esophageal lesions are, or later become, obstructive, the book really covers the whole realm of esophageal diseases The different subjects are treated in a clear, concise manner, important points are brought out by beautiful arrangement of the material from a typographical standpoint, and the illustrations are unusually distinct and helpful.

The author evidently bases his opinions on a very large personal experience, as well as quoting from the literature. At the end of each chapter is a complete bibliography while describing the theories and technique of all methods of treatment, he always recommends what he has found to be most effective, and his results seem to coincide very closely to results observed in this country

In the last chapter he makes a strong plea for radical operative removal of esophageal carcinoma

This is a book for specialist and general practitioner alike, its index making it a particularly valuable feature for the latter

A.

THE HEALTHY BABY The Care and Feeding of Infants in Sickness and in Health. By ROGER H. DENNETT, B.S, M.D New Edition 12mo of 266 pages. New York, The Macmillan Company, 1929 Cloth, $1.25

As would be expected from the character of the author, this is one of the better of the baby books for mothers

The reviewer wishes he could be as confident as the author in his ability to make patients immune to colds, and he does feel that his lateness in giving and adding most foods is exaggerated conservatism, but it is safe advice, and in most of his recommendations one must agree or consider his criticism trifling

The book can safely be recommended to mothers

W D L.

DEVILS DRUGS AND DOCTORS The Story of the Science of Healing from Medicine Man to Doctor By HOWARD W HAGGARD, M.D Octavo of 405 pages, illustrated. New York and London, Harper & Brothers, 1929 Cloth, $5.00

For the one who has an interest in the "antiques" of medicine but prefers to do his research vicariously, this rather unusual volume presents as fine a collection of old wood-cuts and engravings as could be found in many a dusty hour among the stacks of a large medical library

The progress of medicine and its influence upon civilization are traced from the devil-doctor, the priest and the medicine-man of the ancients, through the horrors of the middle ages with its Doctors Sangrado its barber-surgeons and the refined cruelty of its mid-wives, to the modern health crusader and preventive medicine.

The text is well arranged and a complete index makes the work a valuable hand-book whereby the mouthings of the present-day cultists, faddists and "anti" societies can be held up to ridicule through the medium of the deadly parallel

J L. N

MODERN MEDICINE. Its Theory and Practice in Original Contributions by American and Foreign Authors Edited by SIR WILLIAM OSLER, Bart., M.D Third Edition. General Index. Octavo of 126 pages Philadelphia, Lea and Febiger, 1928. Cloth, $1.00

This general index to the six volumes of this set adds to the completeness of the work and enhances its usefulness It makes more readily accessible the material contained in the various volumes upon subdivisions of the different subjects

F

DIAGNOSIS AND TREATMENT OF DEFORMITIES IN INFANCY AND EARLY CHILDHOOD By M F FORRESTER-BROWN, M.S, M.D (Lond) Octavo of 199 pages, illustrated. New York, Oxford University Press, 1929 Cloth, $4.15 (Oxford Medical Publications)

Here is a little gem. A concise volume of 190 pages with plenty of illustrations, boiled down and robbed of all verbiage The pediatrist will welcome this addition to his library It contains a great deal of practical information which he frequently has difficulty in weeding out of the large textbooks on orthopedic surgery It is devoid of statistical tables, historical introduction, and complicated references One doesn't choose to catalogue this volume as a "Notebook," but at times a "Notebook" on a subject is infinitely more usuable than its parent source, and sometimes an author of such has a greater task than the writer of a treatise.

We believe that Dr Brown is Maud Frances Forrester-Brown who studied in Boston The introduction by Sir Robert Jones re-inforces that idea as Sir Robert states that "The author is a disciple of Sir Harold Stiles of Edinburgh and Dr Goldthwait of Boston"

Dr Brown has a splendid conception of bone and joint mechanics, and uses practical methods of applying these principles to the deformities discussed The book has a sincere message to the general practitioner, school doctor, and child welfare worker, along the lines of preventive orthopedics. In this respect the work is an innovation and ought to appeal strongly to the orthopedist as well

One line produced a smile the author was suggesting that plaster of Paris be rubbed into muslin by means of a light trowel—"such as are sold at Woolworths" We never expected to see this great concern enter the field of surgical appliances and attain the distinction of being mentioned in a tome on orthopedics.

D E. M.

SURGICAL PATHOLOGY By CECIL P G WAKELEY, F.R.C.S, and ST J D BUXTON, M.B, B.S Octavo of 904 pages, illustrated New York, William Wood & Company, 1929 Cloth, $12.50

The reviewer believes that this book is a valuable contribution to the working library of surgeons and internists. It is remarkably well up to date as shown by references to Ewing's views on radiosensitivity of tumors, Masson's new theory of melanomata and other subjects under current discussion. The section on the thyroid comprises 46 pages and deserves careful reading Other notable sections are those on the stomach, cholecystitis, chronic appendicitis, endometrial implants, the reticulo-endothelial system, the spleen, bone diseases and brain tumors The author gives the latest views on these subjects The more common diseases are fully discussed including symptomatology where it seems of value. The author has a true gift for writing word pictures of gross pathology At the end of each chapter is a short list of references to recent English literature.

The book is profusely and beautifully illustrated and is a fine example of the publishers art. The reviewer heartily commends this book to the surgeon who wants an up-to-date working pathology by a man who writes well and knows his subject thoroughly

E. B SMITH

OUR NEIGHBORS

PUBLIC RELATIONS WORK IN IOWA

The Iowa State Medical Society has taken a forward step along the lines advocated by the Committee on Public Relations of the New York State Medical Society The October issue of the *Iowa Journal* says

"There has recently been a forward looking development within the Iowa State Medical Society in the way of cooperation with the public health movement In September of last year the Society acting through its Councilors put itself on record as follows

"'Be it resolved by the Council of the Iowa State Medical Society that members of the Society should take an increasing part in all public health work, and especially in all lay organizations having to do with public health, prevention of disease, ' Many steps have been taken to realize this plank in this platform A full time executive department has been set up charged partly with the duty of the promotion of preventive and educational health work This department has been the means of bringing together in important conferences representatives of various statewide organizations which concern themselves with public health A speakers' bureau is being organized with the idea of offering to various local groups physicians who can speak with authority on public health subjects

"In short the medical profession of Iowa has entered on a policy of placing at the disposal of the reading and listening public its scientific medical knowledge interpreted in terms to fit the popular receptivity This happy liaison between medicine and public health is extending rapidly into local areas In at least a score of counties physicians are officers of county public health organizations

"A study made of the public health activities of medical societies shows a wide variety of results of such cooperation Among the things done by these various societies are the following held tuberculosis and heart clinics as one of the regular society programs, promoted employment of public health nurses, conducted weekly health columns in newspapers, aided in diphtheria immunization, cooperated with parent-teacher associations in the summer round-up examinations, endorsed and actively participated in the Christmas seal sale, made use of its members as a speakers' bureau on public health subjects, and interested themselves in various community health projects such as milk inspection, bovine tuberculosis eradication, the early diagnosis campaign and health work in schools

"Physicians who are serving their communities by taking part in public health work have done so because of the sincere desire to be of service, but as Dr George Vincent of the Rockefeller Foundation says 'they have discovered that an increased community interest in personal hygiene, school health, maternal and child welfare is sending more and more patients to private practitioners The public health staffs become in a sense agents for the doctors, who in turn man and strengthen the institutions of prevention'

"If this unanticipated and collateral result has happened, that is as it should be The voluntary public health movement is not concerned with state medicine—in fact the growth of the voluntary movement is a deterrent to the progress of the state medicine idea Its policy is to recognize the private practitioner, especially the family physician in rural communities, as an increasingly necessary and important essential in community life It seeks to better his facilities and to increase his opportunities for service"

BASIC SCIENCE LAW

An editorial in the September issue of *Northwest Medicine*, has the following discussion of the Basic Science Laws, which have been passed by several states

"Interest in the passage of basic science laws has become noticeable in various parts of the country during recent years These laws have been administered for sufficient length of time in Connecticut, Wisconsin, Minnesota, Nebraska and Washington to enable one to arrive at some conclusions regarding their efficiency Recently Arkansas has also joined the list of basic science states

"Results which have been obtained from the administration of the basic science law in Washington offer a striking illustration of what may be attained from this sort of legislation Kelly considers the Washingtn law probably the worst that has ever been tried since it specifies that examinations will apply to all persons applying for license or certificates for practicing medicine or surgery, osteopathy and surgery, chiropractic or drugless therapeutics, thus, as he states, not only recog-

Sooner or later

That baby must be weaned!

"The fact confronts us that the mother who has enough milk for her baby till the fifth or sixth month is in the great minority"
JOSEPH BRENNEMAN M.D *Abt's 'Pediatrics"* Vol 2

Dryco-fed infants progress from breast to bottle feedings without the digestive and nutritional disturbances often attendant upon weaning. Their characteristically healthy color is maintained and normal gains in weight continue without interruption. These facts, proved by many years of clinical history, recommend Dryco for your consideration - - - -

Upon ingestion, Dryco forms small flocculent particles, presenting a wide area of attack for the gastric juices and assuring maximum results with minimum digestive effort It is well borne in even the most difficult feeding cases Free from pathogenic bacteria, the use of Dryco avoids the danger milk-borne infections This fact, together with its simplicity of preparation, are further contributory reasons why physicians all over the world consider it the ideal milk for infants deprived of breast feeding

Send for suggested feeding tables, Dryco samples and clinical data!

nizing cults but establishing a legal classification for them One must not overlook the fact that these cults have been legalized by legislation and examining boards appointed for each of them by name Such legislation was enacted during the war when the doctors of the state were serving in the army or navy and none had a voice in the legislative session when these laws were enacted Ten years later the basic science law was passed, largely as the result of the activity of the public health league

"The following figures will be of interest, showing the results from the administration of this law During 1925, following examinations before their respective boards, licenses were issued to 115 physicians, 55 chiropractors, 19 osteopaths, 10 drugless healers During 1926 the figures were 113 physicians, 42 chiropractors, 35 osteopaths, 27 drugless healers During 1927, before the basic science law became effective on June 1, the numbers were 47 physicians, 29 chiropractors, 38 osteopaths, and 17 drugless healers At the first basic science examination in July, 25 physicians passed with no chiropractors, osteopaths or drugless healers At the two examinations under this law in 1928 there were successful 101 physicians, 4 chiropractors, 9 osteopaths, no drugless healers At the 1929 examinations 95 physicians passed with 5 failures, 9 chiropractors with 12 failures, 8 osteopaths with no failures No drugless healers were successful and 4 failed

"These results indicate the restriction which may be expected in the numbers of irregular practitioners, where the basic science law functions Already it has been announced that the existence of such laws has proved the greatest discouragement for the so-called schools of the cults If they were universally adopted, it would doubtless become a great impetus toward the elimination of these half-baked institutions of learning, and would serve as an inspiration for those desiring knowledge of the healing art to acquire such education from high grade and well established scientific institutions"

DIAGNOSTIC CLINICS IN KENTUCKY

Diagnostic clinics under the auspices of the physicians of Kentucky are described in the October *Journal of the State Medical Association* as follows

"During the past year there has been a considerable increase in the number of county societies which have held diagnostic clinics along the various lines which have been endorsed in our reports for the last ten years This has been particularly true in tuberculosis, and no other factor has been of greater assistance in reducing the sick and death rate from this serious disease than these clinics

"Numerous diagnostic clinics for crippled children have been held by various societies in co-operation with the Kentucky Crippled Children Commission, associated with Rotary and Kiwanis Clubs, Shriners and other similar organizations It is a pleasure to again commend

HELPING THE BOTTLE-BABY *tip the scale* ON SCHEDULE! . . .

Select, from your practice, those bottle-fed babies who are the most undernourished . . . try adding Knox Sparkling Gelatine to the milk formula. .see for yourself that this pure, plain gelatine, dissolved and added to milk, does *in*crease the available nourishment, does *de*crease colic, regurgitation and other disturbances, because it largely prevents excessive curdling by the natural acids and enzyme rennin in the stomach.

The profession is finding gelatine valuable in feeding milk to infants and children, according to the following formula:

Soak, for about ten minutes, one level tablespoonful of Knox Sparkling Gelatine in one-half cup of milk taken from the baby's formula, cover while soaking; then place the cup in boiling water, stirring until gelatine is fully dissolved; add this dissolved gelatine to the quart of cold milk or regular formula.

Be sure to specify Knox Sparkling Gelatine. It is an excellent protein, unflavored, unsweetened, unbleached. From raw material to finished product, every stage of its manufacture is subjected to careful laboratory control.

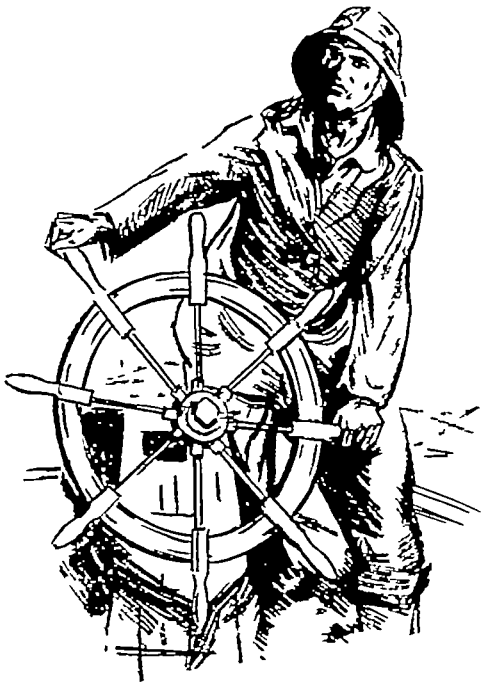
this very effective work under the fine leadership of Miss Marian Williamson, who has so long and effectively served the people of Kentucky Hundreds of children are being restored to usefulness that had heretofore been doomed to a life of invalidism and suffering

"Many county societies have held trachoma and other eye, ear and throat clinics for the indigents in their population Such clinics are under the exclusive control of the county society holding them and they have unquestionably popularized such simple operative procedures, particularly amongst the indigent school children, and have made hundreds of the more fortunate of our people seek similar services Trachoma is rapidly disappearing For the first ten years after this work was organized under the leadership of Doctor John McMullen, of the United States Public Health Service, anywhere from 50 to 100 patients were operated on at the various clinics, and it was necessary to establish temporary trachoma hospitals in many points in the State over periods of several years



"For the seven of the past eight years the General Assembly has continued its appropriation for the support of the Bureau of Maternal and Child Health Under the fine leadership of Doctor Veech and her associates in this Bureau, with the splendid co-operation of the entire profession throughout the State, the maternal death rate has been reduced practically a third, and infant mortality almost a half This is the best answer to the critics of the Sheppard-Tower legislation, which has always met and merited the unanimous approval of this Association"

PUBLIC RELATIONS IN PENNSYLVANIA

Dr William T Sharpless, in his presidential address before the annual meeting of the Medical Society of the State of Pennsylvania, on October 1, 1929, discussed the relation of physicians to voluntary health agencies as follows

"Toward the unofficial or voluntary health organization we also have a duty Our profession cannot afford to withhold its support from any intelligent and earnest body of people working for the public good To do otherwise would open us to the charge of insincerity when we claim that we are the only profession trying to do away with the condition by which we live—namely, disease The work which these lay organizations are trying to do is essentially medical work It belongs to medicine and it needs the direction that physicians can best give There should be no antagonism between the two They

Where Men go down to the Sea in Ships

IN New England the cod is more than a fish It is a tradition And in New England we claim credit for much of the research that resulted in the modern, palatable, vitamin-potent cod liver oil which has been of such value to the medical profession, not only in combating rickets but in building up energy and stepping up resistance to disease

There is no substitute for cod liver oil, and it has been definitely established that its value does not depend upon the presence of one vitamin, but on the combination of Vitamins A and D.

Patch workers on the sea-going steam trawlers, in the shore plants, and in the laboratory are combined into a trained, experienced force that produces for you Patch's Flavored Cod Liver Oil, standardized as to Vitamin A and D potency, presenting this vitamin potency in safe and familiar dosage

And, in addition, it is an unusually palatable product, which palatability we would like to demonstrate to you by sending you a sample

Patch's Flavored Cod Liver Oil

X ray Showing Rickets

X ray of same hand one year later Rickets Healed

Successful Treatment of Rickets—

Successful Prevention of Rickets is not a matter of theory or guess work The relationship between the administration of cod liver oil and the formation of sound, healthy bones is almost as vividly demonstrable by the X-ray as is the difference between a broken bone and a normal one

The X-ray photograph at the left shows severe rickets The X-ray photograph at the right is of the same hand one year later showing rickets completely healed by the administration of Nason's Cod Liver Oil

The antirachitic potency of Nason's Cod Liver Oil is such that 0 01 Gm per day will produce definite healing (as determined by X-ray photographs), in the leg bones of rachitic rats in eight days when added to a diet lacking in vitamin D, the rats being also deprived of ultraviolet light In addition Nason's Palatable Cod Liver Oil is required to have content of fat soluble vitamin A, determined by the U S P method, of not less than 800 units per gram

Nason's
Palatable -Norwegian
Cod Liver Oil

can supply the enthusiasm and the administrative knowledge which many of them have been taught The medical profession can furnish the medical knowledge that is essential to the efficient working of the whole plan We can work together in promoting immunization against disease, in establishing and conducting public-health clinics where prenatal care can be given, where mothers may be taught how to rear their babies and how best to guide them through childhood and adolescence, where periodic health examinations can be made to detect the beginnings of disease and disability, and so a nation of healthy and physically efficient men and women may be reared to carry our country on to its great destinies

"Many minds are haunted by the specter of state medicine in such a program, and others believe it would take away the revenue that the physicians receive This is usually answered by the statement that the quite extensive application of these methods has not affected the physician's revenue, in fact never before, at least in modern times, has the practice of medicine been so good a business as it is today, and we need not fear that well-qualified men who are willing to live simply and work hard (and these conditions are good for all of us) will suffer for want of adequate compensation If the plan outlined and urged by sanitarians and philanthropists alike will result in improved health to our nation, medicine will have to adjust itself to the change Many factors, however, enter into this problem which cannot be discussed here They receive a full consideration in an excellent article published in the Proceedings of the College of Physicians of Philadelphia for this year by Dr Allen W Freeman, of Baltimore, to which all who are interested are referred"

LARGE MEETING OF A SMALL SOCIETY

The *Illinois Medical Journal* of October contains a description of two remarkable meetings arranged by the Schuyler County Medical Society of Illinois The description is as follows

"The Schuyler County Medical Society is one of the smallest societies in the state There are only eight members One year ago the society decided to hold a big annual meeting One hundred and ten physicians attended the meeting This year they decided to have a bigger meeting, September 26 The total registration at the meeting was one hundred ninety-one, a mark attained by but few of the medical societies of Illinois regardless of their size The meeting held at Rushville was well planned in every way Over four hundred invitations were sent to phy-

sicians in fifteen counties of central Illinois The meeting opened with a very fine dinner at the Community House in Scripps Park adjoining the city of Rushville Colonel Chas D Center, Councilor of the Sixth District from Quincy acted as toastmaster and chairman of the meeting

"Dr Herman L Kretschmer, Professor of Urology at Rush Medical College, gave an illustrated talk on "Tuberculosis of the Kidney," instructive, interesting and authoritative

"Dr James H Hutton of Chicago gave an illustrated talk on "The Common Endocrine Disorders," which was unusually illuminating, avoiding the usual 'show cases' mentioned in the talks usually given on this subject.

"The third paper on the program was by the state president-elect, Doctor William D Chapman of Silvis, on 'Puerperal Care' This was an able discussion of an important subject and was of great interest to all present. The subject was selected because the Illinois State Medical Society believes that more obstetrical subjects should be discussed at society meetings, as practically every physician in the state is vitally interested in these problems

"It is the intention of this small society to continue these annual meetings and make them larger and better than ever before Miss Jean McArthur, secretary of the educational committee of the Illinois State Medical Society, was present She had rendered much assistance to the society in advertising the meeting as well as arranging the interesting program"

PUBLIC RELATIONS COMMITTEE IN RHODE ISLAND

An editorial in the October *Rhode Island Medical Journal* discusses a public relations committee as follows

"The Medical Societies, state and local, are in a position to help solve the problem if their members and officers will only devote some thought and study to the problem In Providence, a health survey has recently been conducted by a reliable national association and the Providence Medical Society has shown a very friendly and co-operative attitude in securing the data and furnishing opinions The survey report will soon be published, but the recommendations will accomplish little unless the Society further assists in putting into operation such of these recommendations as are sound and feasible It is probable that the report of the Health Survey will carry a recommendation that the Providence Medical Society appoint a public health relations committee which would stand ready to co-operate

Why Milk of Magnesia with Petrolagar

IT is widely and successfully used in the management of gastric conditions due to hyperacidity accompanied by constipation.

Petrolagar-with Milk of Magnesia (green label) has a prolonged neutralization effect, a low exciting power, if not an inhibitory action on the production of HCL.

A combination most acceptable to internists. Some have reported a marked reduction in the dosage of alkalies, otherwise required to bring about neutralization.

Petrolagar-with Milk of Magnesia has a soothing and alleviating effect on granulation tissue or ulcer surface.

Also for general purposes as a laxative, Petrolagar-with Milk of Magnesia (green label) is preferred by many practitioners because of its increased activity over Petrolagar-Plain. This is due to the presence of milk of magnesia, 8 per cent.

For the convenience of the physician in the treatment of various conditions accompanying constipation, Petrolagar is issued in four types. Petrolagar-with Milk of Magnesia is identified by the number "3" and bears a green label.

and consult with a committee or committees which will undoubtedly be appointed to follow up the recommendations of the Survey Such a committee of the medical society would be in a position to help safeguard the interest of private practitioners and at the same time to assist in the development of all worth while public health measures It is quite probable that the President of the Providence Medical Society will recommend the appointment of such a committee Obviously such a committee will carry considerable responsibility and will have many knotty problems to settle Moreover, it will be necessary that this committee should be a live one which will follow all matters relating to local health matters"

PUBLIC HEALTH INSTITUTE OF CHICAGO

The medical journals have frequently commented on the expulsion of Dr Louis E Schmidt from the Chicago Medical Society last spring, but the reasons for his expulsion were not clearly stated Now, however, the *Illinois Medical Journal* in its October issue, quotes at length from an article in a news-magazine called the *Nor'wester* which published the reasons why the doctor was expelled The article is too long to be reprinted in this Journal, but the following abstracts will show its trend

"Through this exaggerated and unethical advertising the Public Health Institute has acquired thousands and thousands of patients It is an established fact that hundreds of people, scared by the institute's advertising of the dangers of venereal diseases, went there merely for an examination, to satisfy their minds that they were all right

"The Institute does not treat gonorrhea or syphilis when complications have arisen, because they haven't the specialists on the staff or the equipment These cases are sent out to recommended doctors Furthermore, the treatment of complicated cases requires more skill and time than they are able or willing to do

"Such an institution as the Public Health Institute is not needed in a city like Chicago where there are enough doctors, hospitals and free clinics to take care of thrice the amount of work now handled by them, at less cost and more safely The claim of The Public Health Institute that it renders cheaper medical service is something that has yet to be proved—thousands of doctors do this work at less cost and do it immeasurably better For the very poor there are hundreds of clinics and philanthropic agencies"

MEDICAL EXAMINATION FILM IN IOWA

The September issue of the *Journal of the Iowa State Medical Society* has the following description of a medical film

"'Many Happy Returns' is the title of a movie film purchased by the Iowa State Department of Health to be sent free to county medical societies and other organizations for their use This film demonstrates the benefits accruing from the complete periodical physical examination It also depicts the process followed in making a complete physical examination

"The story will not be interesting in a medical way to physicians, but the story or plot, carried by the picture, will hold the attention of lay audiences bringing home to them the necessity and benefits of such examination at least annually (on their birthday) and indicates a method of keeping well and fit, thereby prolonging their lives and extending their period of usefulness as well as pleasure

"Any medical society desiring the use of this film should write to the State Department of Health The film is of standard size and can be used in the standard machine used for motion pictures Medical societies desiring to keep the film for several days to a week for use in local picture houses should specify the length of time when they make their request"

DEFENSE OF PHYSICIANS IN OREGON

The following item from *Northwest Medicine* for August is from the report of the Committee on Public Defense, and sets forth the defense of physicians in malpractice suits

"This report is for the period from September 20, 1928, to May 16, 1929 At the time of our last annual session there were eleven suits pending against members Five new actions have been instituted, making a total of sixteen cases

If you believe that

POLAND SPRING COMPANY

Dept K

680 Fifth Avenue

New York City

"In the sixteen cases under consideration, two have been nonsuited in favor of the physicians, two have resulted in jury verdicts for the physicians, and two verdicts have been rendered in favor of the plaintiffs, one for $7,500 00 and one for $1,000 00 Both of the latter cases will be appealed, and it is possible that they may be ultimately decided in favor of the physicians Ten suits are still pending, but many of these are very old cases, and it is unlikely that over half of them will ever come to trial

"The committee again urges every member to provide himself with a liability policy at the low rate available through special arrangement with the large insurance companies"

MEDICAL SOCIETY PRACTICE IN WISCONSIN

How the Outagamie County Medical Society is practicing medicine is told in the October issue of the *Wisconsin Medical Journal* as follows

"The county nurse discussed with the members of the county medical society the possibility of securing a physical examination for all school children including any preschool children that might be brought to the school at the time of the examination

"The county medical society discussed it and following the discussion the county medical society sent a representative committee to the county board for the purpose of presenting this whole matter to them for consideration The county nurse discussed this question with members of the county board in addition to the presentation made by the Committee of the county medical society, with the result that the county board of supervisors appropriated a sum of $2,000 00 for this purpose

"The medical society stated that they would hold these examinations at the school house and would do the entire group for the sum appropriated"

CARDIOVASCULAR EFFECTS OF DIRECT INJURY TO THE CHEST

MORRIS H KAHN, M.A., M D, and SAMUEL KAHN, B S, M D, NEW YORK, N Y

THE superficial position of the heart and pericardium directly behind the sternum and the adjacent cartilages exposes them to danger from injuries to the anterior chest wall With or without injury to the ribs, or even without obvious external bruising, an external blow may produce very serious damage to the intrathoracic structures Corresponding to the injuries that take place to the lungs, liver, kidneys or spleen in serious accidents, it may be plausibly surmised, the heart will suffer similarly the effects of sudden concussion or compression. The character of these effects will depend upon the status of the heart cycle at the moment of the accident, the resilience and resistance of the thoracic wall, and the form, momentum, and direction of the injuring force The mechanical process in such accidents is subtle, of course, and the clinical picture often very difficult to understand

The principal clinical types of traumatic heart lesions that occur in consequence of direct and indirect violence may be classified under the following headings

I. Direct Injuries
- A Contusion and concussion of the thorax
  - 1 Injury to the pericardium
  - 2 Auricular fibrillation
  - 3 Extrasystolic arrhythmia.
  - 4 Heart block
  - 5 Injury to the valves of the heart
  - 6 Injury to the aorta
  - 7 Injury to the musculature
  - 8 Rupture of the heart
  - 9 Miscellaneous types
- B Penetrating wounds
  - 1 Fatal
  - 2 With recovery and post-traumatic effects

II Indirect Injuries
- A From falls with no direct injury to the chest
- B Heart strain

Inasmuch as pathological examination of the heart tissue in the milder form of accident to the thorax is not possible, we can only consider these cases from the standpoint of analogous experimental studies It is only from the symptoms and the clinical evidence of disturbance of rhythm, or other functional changes, that we can estimate the extent and determine the localization of the lesions In severe cases, in which the clinical evidences are marked, or in cases that terminate fatally, an exact discovery of the damage produced is ofttimes obtained by autopsy

Injuries to the thorax are common occurrences in various industries This applies particularly to all those occupations in which objects are moved about, pulled forcefully out of piles, or thrown from one place to another Being run over by a vehicle is one of the most frequent causes An equally frequent accident is the crushing of the chest when a person is caught between two colliding vehicles, or between one such and a stationary object A hazard also lies in unprotected straps around the wheels of machines Falling directly to the ground as in tripping is a common cause of thoracic injury Injury to the heart may also be produced indirectly according to the natural laws of inertia when one falls down a varying distance, in which case the force is applied directly to some part of the body other than the chest Less frequent are the intrathoracic injuries produced by penertating objects such as bullets, knives, or the sharp fragments of fractured ribs

Contusion and Concussion of the Thorax with Intrathoracic Injuries

A blow to the region of the heart may cause a contusion of the precordial tissues sufficient to extend to the parietal layer of the pericardium If this is the full extent of the damage, the symptoms may be slight and complete recovery may follow in a few days But in some cases, the effect of the injury is not localized to the mural tissues As the thoracic wall is markedly yielding, a severe blow or sudden compression may momentarily alter the shape and volume of the intra-

From the Department of Cardiovascular Diseases, Beth Israel Hospital and the State Department of Labor—New York City

thoracic space Such a distortion may involve a displacement of the heart and mediastinum, and may be very severe, producing the symptoms of shock, and even resulting in death This may happen with surprisingly slight, or even with no, evidence of external injury to the thorax

To illustrate the obscure clinical effects often produced by direct violence to the chest and the practical importance of these cases from the standpoint of the ensuing disability and the compensation liability, the following case is briefly summarized

Jeremiah McC, an automobile mechanic aged 55, was struck by the fender of a suddenly propelled truck, in the region of the left lower ribs and left groin When he regained consciousness he found himself seated against a fence to which he had been carried He had intense pain in the left lower abdomen and an aching, numb sensation in the left hypochondriac region There were no abrasions of the skin, no bleeding from any part of the body, and no ecchymoses He had no cough or hemoptysis, no vomiting, melena or hematuria He returned home by trolley, walking two blocks without assistance, and went to bed That night the sharp localized pain in the left lower ribs became worse, especially on deep breathing, and there was some local tenderness He felt dyspneic, especially in the recumbent posture and had palpitation at times Two days later, pleurisy was diagnosed

One month after the accident, the patient had a sudden severe, localized gripping pain over the left lower ribs, considerably below the region of the breast He did not faint, but was relieved by hypodermic medication Similar attacks of momentary localized pain recurred, not radiating to the arms, neck, or chest, with pallor and cold sweat, followed by palpitation He had slight dyspnea and palpitation on moderate exertion, and was unable to breathe easily in the recumbent posture The tenderness over the ribs finally disappeared He was not examined at this time

Physical examination four months after the accident showed the left border of the heart just outside the nipple line, 10 cm from the median line The right border percussed 4 cm from the median line The apex beat was palpable in the fifth and sixth spaces in the nipple line The sounds at the apex were good and the basal sounds were normal There were no murmurs and no tender spots on the chest wall There was an area of pain over the fifth and sixth left interspaces corresponding to the region of the heart apex The blood pressure was 122/70 There was no evidence of pleural affection The electrocardiogram showed a rate of 66 and was otherwise negative

One year after the accident, the patient appeared in good condition and for a length of time had not had any further attacks of pain or discomfort in the chest He still claimed some disability on account of the shortness of breath, but clinical evidence did not indicate any further disability from the accident

Summary—In this case, the injury produced apparently no permanent affection of the heart, although the symptoms and the attacks that the patient suffered from may be attributed to some direct trauma to the heart The nature of the temporary damage produced is not clear

Involvement of the Pericardium

The pericardium may react to a contusion or concussion of the chest with the development of acute pericarditis This is often fibrinous in character, and often with slight effusion Pericardial injury may develop following a sudden fall or lurch forward in which the chest is struck against a projecting surface or edge A blow to the chest by a missive or a fist, as in boxing, may be the history Accidental traumatic pericarditis has to be differentiated from that form which occurs in an attack of sudden coronary closure or so-called stenocardia

The following case under our observation presented the question of traumatic pericardial involvement

Edward A K aged 49, tripped and was thrown heavily forward to the ground Later in the day, he felt some tightening in the chest and had a little difficulty in breathing That evening he complained of shortness of breath which became worse the next day He remained in bed for a month after the accident with a diagnosis of acute pericarditis

Physical examination a month later showed marked dyspnea, with a slow pulse of small volume The heart sounds were somewhat muffled There was no evidence of endocarditis and no symptoms or signs to suggest myocarditis The lungs were negative and the liver was not enlarged About five months after the accident, cardiological examination showed the heart to be moderately enlarged, with the right border 4½ cm and the left border 11 cm from the median line in the fifth space The apex beat was not visible nor distinctly palpable, and was heard best in the fifth space inside the nipple line, at a regular rate of 78 per minute The second aortic sound was slightly accentuated The brachial arteries were somewhat tortuous and the blood pressure was 140/95

The electrocardiogram showed normal sinus rhythm, left ventricular preponderance, inversion of the *T*-wave in lead I, and the *P*-wave isoelectric in lead III Teleroentgenogram showed the heart enlarged to the right and left with definite hypertrophy of the left ventricle The ascending aorta was not dilated

The claimant resumed lighter work for five months or more before he died rather suddenly He had not consulted a physician for these five

months prior to his death Autopsy was not obtainable

Summary—There is definitely a history of an accident to the chest followed promptly by cardiac symptoms and the development of pericarditis Whether or not the co-existence of acute coronary closure figured in its production must remain speculative Five months after the accident, there was enough indication in the cardiac enlargement, hypertrophy of the left ventricle, dilatation of the ascending aorta, arteriosclerosis in the aorta, and changes in the electrocardiogram from which to conclude that there was some pre-existing affection of the heart Yet, after the death of the claimant and from the available data, one cannot escape the suspicion that as a result of the accident, there was injury to the heart which produced pericarditis

Auricular Fibrillation

It is well known that bodily effort or physical stress may produce auricular fibrillation[1] In these cases, the onset in point of time is clearly defined, immediately following and definitely associated with unusual labor

But the literature is very scant concerning instances of auricular fibrillation that follow direct violence to the chest.[2] What the pathological changes are that produce this condition, one cannot declare with certainty However, the possibility of sub-epicardial ecchymosis in the auricular muscle must be considered The cardiac damage in these cases is not disputable The symptoms produced by its development are quite conspicuous, promptly causing more or less total disability It is known that fibrillation diminishes greatly the cardiac output as a result of which, symptoms of deficient cardiac function develop[3] —dyspnea, palpitation, occasional sticking pain in the precordium or just below the left breast as well as the development of cough due to pulmonary stasis and edema of the legs

The accidental occurrence of auricular fibrillation will go on to spontaneous recovery in a short time, or to recovery following a period of rest and the use of special medication, or may be followed by recurrence with the persistence of the heart arrhythmia In fact, once established, auricular fibrillation has a tendency to recur or even to become permanent

Illustrating this type of occurrence is the following case which has been under our observation for some time

Joseph G., a tall, well-nourished young carpenter, aged 33, was struck across the front of his chest as he was looking up, by a plank of lumber which fell on end from a building scaffold 18 feet from the ground He fell backward, momentarily dazed, stood up for a few minutes feeling very weak and leaning against the building for support There was diffuse soreness in his chest, and he 'breathed hard as if all out of wind" He then continued lighter work with intervals of rest. When walking he felt weak and dizzy, and stumbled in his gait He worked half of the following day During two weeks of hospital observation, he felt weak, with pressing pain across the front of the chest.

Three months after the accident, his heart showed no enlargement and no murmurs, but showed rapid auricular fibrillation and a low blood pressure—104/78 There was no evidence in the history and in the physical examination of any previously existing heart condition *X*-ray examination was also negative The electrocardiogram showed coarse auricular fibrillation and tachycardia, but no ventricular preponderance and no indication of any pre-existing valvular disease After a preliminary period of rest and digitalis medication, the patient was given three grains of quinidine sulphate every three hours for several days There occurred quite remarkable improvement with the resumption of normal sinus rhythm The symptoms promptly disappeared The patient was able to walk about with progressive improvement and increasing strength so that six months after the accident, recovery was considered quite complete He then suddenly developed symptoms attributable to another attack of fibrillation This subsided under rest and digitalis medication

Summary—In this case, cardiac symptoms including the feeling of distress and soreness across the front of the chest, followed immediately upon the recorded accident In point of time, the onset is therefore clearly and directly associated with the injury We therefore believe that the condition of the patient had a direct relationship to the accident As negative evidence, there were not present in the history or physical examination any of the other causes such as rheumatism, syphilis, arteriosclerosis, Graves' disease, or any toxemia which might induce auricular fibrillation There was no valvular lesion or cardiac changes incidental to a lesion, such as hypertrophy, accentuation of the basic sounds, or ventricular preponderance in the electrocardiogram

The pathological changes that may have taken place from the injury are necessarily speculative The possibility of subepicardial ecchymosis in the auricular muscle is to be considered The process takes a long time to heal and therefore the auricular fibrillation may last an indefinite period of time

The electrocardiograms taken in this case are of interest (See Figs 1 and 2)

During the preliminary period of observation the electrocardiographic records (A) showed rapid, coarse auricular fibrillation with an average rate of 150 per minute Premature beats occurred arising probably in the region of the A-V node

Two weeks afterwards (B) sinus rhythm had been restored and the effect of digitalis had worn

thoracic space Such a distortion may involve a displacement of the heart and mediastinum, and may be very severe, producing the symptoms of shock, and even resulting in death This may happen with surprisingly slight, or even with no, evidence of external injury to the thorax

To illustrate the obscure clinical effects often produced by direct violence to the chest and the practical importance of these cases from the standpoint of the ensuing disability and the compensation liability, the following case is briefly summarized

Jeremiah McC, an automobile mechanic aged 55, was struck by the fender of a suddenly propelled truck, in the region of the left lower ribs and left groin When he regained consciousness he found himself seated against a fence to which he had been carried He had intense pain in the left lower abdomen and an aching, numb sensation in the left hypochondriac region There were no abrasions of the skin, no bleeding from any part of the body, and no ecchymoses He had no cough or hemoptysis, no vomiting, melena or hematuria He returned home by trolley, walking two blocks without assistance, and went to bed That night the sharp localized pain in the left lower ribs became worse, especially on deep breathing, and there was some local tenderness He felt dyspneic, especially in the recumbent posture and had palpitation at times Two days later, pleurisy was diagnosed

The claimant resumed lighter work for five months or more before he died rather suddenly He had not consulted a physician for these five

sonable to exclude direct trauma to the heart as a related cause of the extrasystoles No one can gainsay that the injury was not a factor in causing the extrasystoles

Heart Block

The location of the trauma in the myocardial structure will determine the functional disturbances or arrhythmia that may develop Cases of heart block have been reported from direct injury to the chest Of course, with penetrating wounds the effect of an injury in the region of the bundle of His produces clinically what in the physiological laboratory is recognized as the Erlanger ligature But the condition of heart block may follow trauma to the precordium without any penetrating wound, or even with no obvious injury

Rosenson reports a case of temporary partial heart block in a boy aged 10 who had received a hard fist punch over the precordium [5] Following the blow, he complained of weakness and a peculiar fluttering sensation over the region of the heart. He was unable to walk, felt faint and was carried to bed Two days later, on attempting to walk, he fell and was unconscious for a few minutes Two weeks after the injury to his chest, he still suffered slight dyspnea on exertion. The heart showed no enlargement There was a pulmonic systolic murmur, functional in character The sinus rate was 120 The electrocardiogram showed varying grades of heart block with a rapid auricular rate The *T* wave was inverted in lead III The conduction time was 0.28 of a second Within a month after the accident, with rest in bed, the child made a complete recovery The electrocardiogram indicated return to normal rhythm

Injury to the Valves of the Heart

Injury to the front of the chest, with or without injury to the ribs or even without obvious external bruising, may cause rupture of one of the valves in the heart The causes noted are blows on the front of the chest, compression between wagons, kicks, and falls from a height. With the increase of automobile casualties, valvular injury is not infrequently the result of accidents in traffic

Rupture of an aortic or mitral valve may be produced experimentally by smiting the walls of the thorax in animals, or in the cadaver as in the experiments on the cadaver reported by Potain and his co-workers [6]

In the mechanism of such an accident, the external blow violently compresses the thoracic cage The glottis may be closed in deep respiration and the thorax held rigid We may conceive of a violent concussion of the distended aorta just at the moment of full ventricular systole Under such circumstances, rupture of an aortic cusp might take place

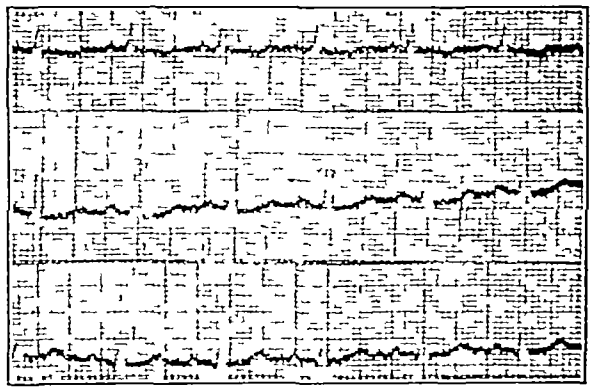

FIG. 3 Paul H.—*Electrocardiogram showing apical ventricular extrasystoles*

In this category of aortic valvular lesion, following direct injury to the chest belongs the interesting case that is reported below

John O., a robust fellow, aged 26, had been working as a laborer for some years One afternoon, while he was supporting with his outstretched arms a two-ton platform standing on edge on the floor, it fell over toward him He was thrown supine, the weight of the platform falling against his chest It was raised and the patient pulled away from under it unconscious; he so remained lying on the floor for about five minutes When he roused, he felt severe aching pain across the front of the chest and in the epigastrium He also had difficulty in breathing, but suffered no palpitation, cough, hemoptysis, or dizziness at that time He was then taken by ambulance to a hospital

The chest showed no deformities, no evidence of external injury and no ecchymosis There was diffuse tenderness over the midsternal region, the second and third left ribs, and also over the xyphoid region No fractures had taken place

Physical examination three months after the accident showed the heart to be markedly enlarged to the left and right The left border was 12 cm from the median line, outside the nipple line, the right border was 7 cm from the median line in the second, third, and fourth spaces The apex beat was heaving, in the fifth space below the left nipple Over the apex and precordium, radiating upward to the aortic area and toward the vessels of the neck there was a loud blowing systolic murmur replacing in good part the first heart sound Over the base there was heard a short diastolic blowing murmur There was present a Corrigan radial pulse and also a visible capillary pulse Over the femoral artery there was heard the pistol-shot sound of ventricular systole and just preceding this was another systolic sound There was visible brachial pulsation with evidence of slight brachial and moderate temporal tortuosity The brachial blood pressure was 140/34, while the popliteal blood pressure

off the electrocardiogram showed a rate of 75 per minute No premature beats occurred The P wave was rather sharp and peaked

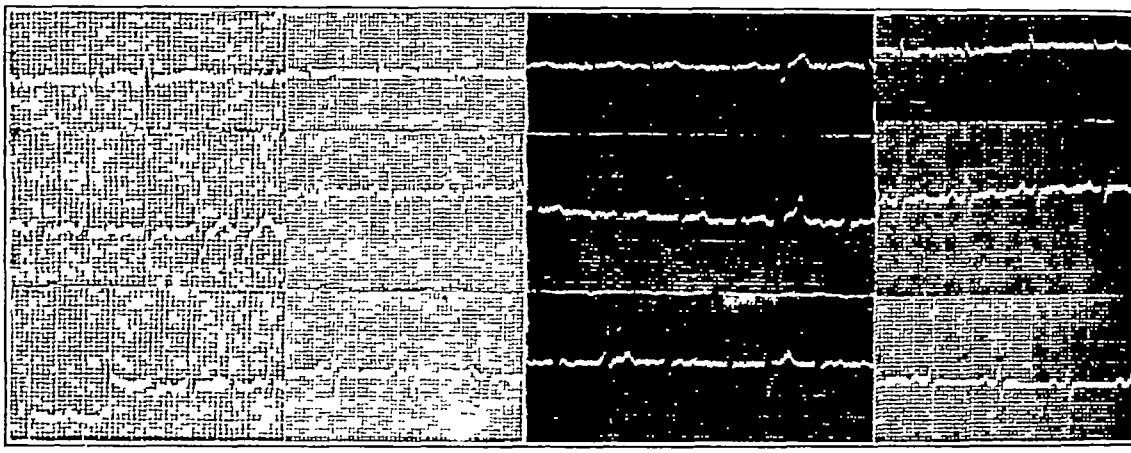

FIG 1 Joseph G—*Electrocardiogram three months after direct injury to the chest and heart*

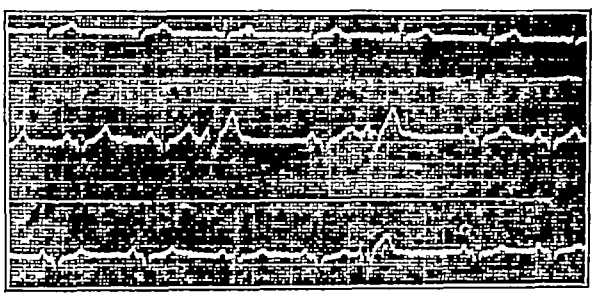

FIG 2 Joseph G—*Three months after restoration of sinus rhythm*

A few months later, without medication, the patient suddenly developed an attack of fibrillation (C) that lasted a week and subsided under digitalis medication (D)

Extrasystolic Arrhythmia

Perhaps the most frequent form of irregularity of the heart action that takes place is that known as extrasystolic arrhythmia, in which premature beats interrupt the normal heart rhythm These may arise in the auricle or at any point in the ventricular musculature The usual cause for their occurrence is focal myocardial irritation at one or more points, due either to rheumatic inflammation or to coronary changes A less common cause for their occurrence, however, lies in the lesions produced in the cardiac tissue by heart strain,[4] by direct injury from blunt violence such as blows to the chest, or by indirect injury as in falling from a height

Where trauma is under consideration as a cause of this form of irregularity, it may be held liable by the process of exclusion In young people, toxic and infectious causes have to be eliminated as possible factors In older people, arteriosclerosis usually complicates the picture. It is therefore the clinical relationship between the accident and the development of this form of irregularity that guides us to the establishment of a causal association

The following case serves as an example in which the consideration of this condition comes into play

Paul H, a young carpenter twenty years of age, fell three floors down an elevator shaft to a planked flooring He regained consciousness in a hospital where the lacerations of the face and head were treated He had pain across the back of the right side of the chest, but no other external evidence of thoracic injury Although there were no other effects of intracranial trauma, he had some dizziness, unsureness of gait, and deeper injury to the nasal bones for several days after Following the accident, he began to feel slight dyspnea on exertion and palpitation which was worse at night or on standing up

Examination of the heart showed an occasional ventricular premature beat in a rate of 70 per minute The sounds were all clear and of good quality There were no other signs of intrathoracic involvement

Polygraphic and electrocardiographic tracings showed the extrasystoles arising from one focus near the apex of the heart. There was moderate sinus arrhythmia, but no ventricular preponderance (See Figure 3)

Summary—In this case, assuming that the extrasystoles were not present before the accident, there are two possible sources, both in consequence of the trauma, from which one may expect the development of extrasystoles One is a central focus due to the injury to the brain, and the other is direct trauma to the heart In the absence of other central or cerebral symptoms, this origin may be excluded The severity of the direct injury to the chest makes it almost unrea-

after the accident, he could not lie on either side, and later could not lie on the left side

Physical examination a year and a half later showed the heart not enlarged, and the sounds at the apex of good quality Over the aortic area, there was a soft blowing systolic murmur, but no basic accentuations There was a tender spot on the third left rib, two inches from the median line, and also tenderness over the sternum just below the manubrio-gladiolar junction The temporals were tortuous, and the blood pressure was 132/90

A teleroentgenogram showed the cardiac shadow normal in size and configuration, but the aorta appeared moderately elongated with slight prominence of the descending portion of the arch

One year later, the patient developed angina pectoris with repeated typical attacks of pain in the precordial and sternal regions, radiating to the left arm There was weakness and inability to move about with comfort Examination showed a pulse rate that increased considerably on slight exertion, and a low blood pressure Otherwise the physical examination showed no new evidence The electrocardiogram which had previously been negative, at this time showed a conspicuous alternation of the *R* wave Otherwise the waves would be considered entirely normal

The disability was adjudged total and permanent

Summary—The clinical sequence of events is definite Following direct injury to the chest wall, the patient became unconscious The subjective symptoms that followed are the main guide and evidence of some affection behind the sternum Involvement of the aorta or heart, and even laceration or contusion with ecchymosis, may occur following severe injury Over the aortic area, there was a soft systolic blowing murmur There was a tender spot on the third rib, two inches from the midline as well as below the manubrio-gladiolar junction This, together with the r-ray findings, suggests the possibility of aortic involvement There is evidence of slight general arterial changes which are no doubt of the same type as the aortic lesion and entirely independent of the injury The later development of angina pectoris is corroborative evidence of the localization of the traumatic lesion The atheromata in the aorta following the injury obviously spread to the coronary arteries and induced the attacks of angina pectoris

It is mainly, however, by the record of the injury and the patient's symptoms that we are compelled to conclude that there was damage to the aorta with subsequent cardiac symptoms and angina pectoris—all on the basis of the accidental lesion There may also have been injury to the connective tissue at the base of the heart, in the region of the insertion of the large vessels into their pericardial covering This is speculative, however The duration of the symptoms is usually much prolonged It often takes years before the patient can resume strenuous activity, and the pain often recurs

Rupture of the Heart

The relation of trauma to rupture of the heart is well recognized, particularly when it concerns penetrating wounds Traumatic rupture is generally due either to gunshot wounds or to stab wounds These will be taken up at the end of this section We shall here concern ourselves with rupture of the heart due to non-penetrating injuries This may follow a blow, a fall, or a compression injury to the chest, as well as violent effort some time after the injury has been received

The symptoms of rupture of the heart are in reality the terminal phenomena that take place They usually consist of the momentary symptoms of collapse and sudden death The mechanism for the occurrence of death depends upon the intra-pericardial pressure When the pressure in the pericardium becomes equal to that in the right auricle, blood no longer enters the heart from the systemic veins and death promptly ensues

Krumbhaar and Crowell report a very interesting case, with autopsy findings, showing a very pointed relation of the trauma to rupture of the heart" A man, aged 38, of dissolute habits, during a drunken debauch at Atlantic City, fell heavily against a box for mixing mortar, hitting the edge against his precordial area When seen several days later, he had considerable precordial pain, but no diagnosis was made No further details were available except that death occurred suddenly At autopsy, the pericardial cavity was filled with clots of blood About half way up the outer wall of the left ventricle in the visceral pericardium, was a transverse tear, 3 cm in length which extended into the myocardium for about two-thirds of its depth Histologically, the coronary arterioles were reported as occluded, and the myocardium near the rupture was acutely necrotic

It is probable in this case that trauma played a prominent part by injuring the coronary artery with subsequent thrombus formation Rupture occurred "spontaneously" as a result of the thrombosis

Penetrating Wounds

Besides rupture and laceration of the organ produced by contusion and crushing injuries, external penetrating wounds of the heart occur passing through one or more of the heart walls Gunshot wounds constitute a large percentage of the penetrating wounds of the chest In addition to these, fractures of the ribs and sternum play an important role In these cases, the sharp end of a broken fragment may directly lacerate

was 180 systolic and heard faintly to 250, the diastolic pressure sound was heard at zero

Radiographic examination revealed some pulmonary congestion on both sides The heart was horizontal in position, enlarged to the right and left The left ventricle was rounded and prominent The retrocardiac space showed the descending aorta There was no definite evidence of enlargement of the left auricle, as demonstrated by contrast-filling of the esophagus The findings pointed to enlargement of the left ventricle and right auricle, and suggested enlargement of the right ventricle

The blood Wassermann reaction was *four plus*

The subsequent progress of the case was very rapid Pain and distressing pressure across the chest became more and more marked compelling the patient to sit up almost all day and all night Frequent attacks of cardiac asthma developed with enlargement of the liver, congestion of the pulmonary bases, and progressive edema of the legs The mild antiluetic treatment that was instituted was not of any help, and from the observation, did not contribute to the sudden death which occurred four and a half months after the accident Unfortunately, no autopsy was obtained

Summary—From the history of the severity of the injury, in the accident, one is compelled to adduce a causal relationship between it and the condition of aortic regurgitation ending in cardiac failure and death Because of the four plus Wassermann reaction, we cannot be certain in this case that the heart was normal before the accident A previously diseased valve is more susceptible to traumatic effects than a sound valve

The duration of life following traumatic rupture of a valve is very variable Immediate death may occur Temporary recovery may be sufficient to allow for the resumption of light work Even healing may occur Prognosis is better in cases with a pre-existing valvular regurgitation, as in these the heart has already undergone compensating hypertrophy

Injuries to the Aorta

Besides injury to the aortic cusp, the wall of the vessel frequently suffers in accidents due to direct violence to the front of the chest A blow on the chest, a sudden fall, or the jar of an accident may cause rupture of the aorta with the formation of a dissecting aneurysm This has been recognized since the time of Vesalius Usually, the cases present the symptoms of ordinary saccular aneurysm of the aorta, but in one case recorded by Allbutt, there was dilatation of the aorta In aneurysm of the abdominal aorta, trauma is a very common etiological factor The essential pathology consists of a split of the intima and inner portion of the media, a dissecting aneurysm may follow with healing or with a rupture, a saccular aneurysm may form, or the wall of the aorta may rupture completely

Injury to the Heart Musculature

A number of cases in the literature indicate strikingly that small foci of myocardial damage may develop as the direct result of external violence

Whenever a colliding force has been directed against the precordial region of a patient, the possibility of myocardial damage must be kept in mind If fracture of the ribs or injury to the pleura have occurred such suspicion becomes emphasized The presence of irregular action which supervenes upon violence to the heart is a significant sign Although the pain has no particular characteristics, it is usually localized over the injured area and sometimes radiates to the left axilla or below the left breast In most mild cases of myocardial damage due to external violence, the signs of a transitory pericarditis develop Usually the heart sounds are lessened in volume and deficient in muscular quality, although no murmurs need be present Particularly significant is the persistence of a rapid heart rate in the absence of fever The irregularity of the pulse and its variability of rate are very important

We may include the following interesting case of ours in this group

Christino G, aged 45, had been pushing a hand truck for two years without pain or discomfort One day, a very heavy load falling from a height weighted the far end of the hand-truck, catapulting the handle end upward The cross-bar struck the patient across the sternum, just at the manubrio-gladiolar junction He took two or three steps back, fell to the ground unconscious for a few moments, and was dazed when he got up He felt a severe burning pain in the midsternal region, with dyspnea and distress in taking a satisfying breath The burning was also felt in the mid-dorsal region, but did not radiate to the arms, neck or other points of the chest There was also dizziness after moving

One month later, he developed inconstant pain in the left nipple region for which he stayed in bed for one week He returned to bed at times with a burning sensation in the middle of the chest, and a sticking pain in the nipple region He became fatigued easily and had faintness at times after the accident At times, he also felt a sudden rapid palpitation, especially during the night and slept only spasmodically, waking with pain, burning sensation, dyspnea, and cough There was no wheezing nor hemoptysis Gradually, the burning sensation lessened and he then felt the sensation of a lump in the midsternal region At times, he also had pain in the same region on deep breathing For seven months

trating violence, small foci of myocardial damage may develop

14 It must be recognized that milder injuries of the myocardium may take place consistent with life over a varying length of time

15 Rupture of the heart may follow non-penetrating injuries to the chest, as well as violent effort some time after the injury has been received

16 The symptoms of rupture of the heart are in reality the terminal phenomena that take place They usually consist of the momentary symptoms of collapse and sudden death

17 The mechanism for the occurrence of death depends upon the intra-pericardial pressure When the pressure in the pericardium becomes equal to that in the right auricle, blood no longer enters the heart from the systemic veins and death promptly ensues

STUDIES IN INTESTINAL INTOXICATION 2

Bacterial Complement Fixation Tests in Infections of the Gastro-Intestinal Tract.—Improved Technic and New Therapeutic Application.

By CLARENCE W LIEB, A.M., M D and GEO H CHAPMAN, B.A.Sc., NEW YORK, N Y

COMPLEMENT fixation reactions have been used with a moderate degree of diagnostic success in some types of gonorrheal infection, tuberculosis, glanders and to a small extent in a number of infections due to other bacteria and protozoa, particularly amœba A few workers have used complement fixation as an aid to the diagnosis of infections in which some group of streptococci might play an etiological role In so far as we are aware, complement fixation reactions in bacterial diseases of the gastro-intestinal tract have not been studied with the degree of thoroughness which the importance of the subject demands We might even go as far as to say that bacterial complement fixation tests, as usually performed, are considered of doubtful diagnostic value.

By a technic, which is outlined below, we believe we have been able to make these reactions of considerable diagnostic value in all chronic infections and particularly in infections of the gastro-intestinal tract Our experience justifies the conclusions that focal infections, primarily outside the alimentary tract, play a statistically minor role in the production of chronic disease and that wherever the primary infection may be, secondary infections of the gastro-intestinal tract may eventually develop through hematogenous or gravitational sources

Our criticism of the usual bacterial complement fixation technic is directed toward the failure of proper antigenic titration and the small number of antigens used Instead of a single antigen, we originally employed 135 and used them on every blood examined over a period of two years Since our object was to develop a test which could be used clinically, we finally pooled these into groups and found that these group antigens gave us more diagnostic information than had previously been obtained by the single strains It was difficult for the average practitioner to understand a laboratory report covering nine pages and the titre of the antigens was extremely difficult to control Consequently we finally adopted the following series of group antigens

Antigen number	Name	No. of strains in antigen
1	Aerobacter aerogenes	5
2	Typical non-hemolytic coli	5
3	Atypical non-hem. coli	5
4	Narrow hemolytic coli	6
5	Wide hemolytic coli	6
6	Salmonella group	6
7	B typhosus	1
8	Dysentery group	9
9	B pyocyaneus	2
10	Proteus	4
11	Alcaligenes	4
12	Friedlander	3
13	Diphtheroids	3
14	C. welchii	7
15	Other anaerobes	8
16	Streptococcus viridans	7
17	Non-hemolytic streptococci	3
18	Hemolytic streptococci	5
19	Non-hemolytic enterococci	4
20	Enterococcus viridans	4
21	Hemolytic enterococci	4
22	Staphylococcus albus	4
23	Staphylococcus aureus	4
24	Gonococcus	7
25	Neisseria (meningococci and catarrhalis group)	5
26	Monilia	3
27	Hemophilus (influenza, etc.)	2

Each one of the single strain antigens had been standardized over the period of two years before being used in the test and each strain was added to the pooled antigen in proportion to its titre

We found that, by the usual methods of complement fixation, a given bacterial antigen might give a strongly positive result with a given blood, but if other bacterial antigens were also employed, they would also give positive results This is

the tissues of the heart The seriousness of these injuries depends upon the amount of trauma inflicted upon the intrathoracic structures

Freese reports a case of a negro who was stabbed and immediately operated on while he was unconscious, with feeble respirations, imperceptible pulse, widely dilated pupils, and cold perspiration [8] There was a wound half an inch long, in the fourth space to the left of the sternum After removal of part of the fourth and fifth left ribs and the costal cartilages, a wound of the pericardium was seen exuding blood When the clot was removed from the pericardial sac, the heart wound was seen in the posterior wall of the left ventricle, a little above the apex This was sutured, the pericardial wound closed, and the musculo-cutaneous flaps replaced on the chest wall The patient recovered without any subsequent cardiac embarrassment.

Under this heading belongs also the consideration of the question of injuries to the blood vessels in the thoracic wall These frequently complicate penetrating wounds The internal mammary artery and intercostal arteries may give dangerous and even fatal hemorrhages within the chest The rupture of the larger vessels in the thorax such as the superior vena cava has also been discovered following penetrating wounds

In one case, reported by Stephens, a man of 42 fell into a cellar, fracturing the sternum at the sternal angle [9] On opening the chest, a marked extravasation of blood was found behind the site of the fracture, due to a tear in the superior vena cava

There is a case reported by Fisher of a negro 24 years old who was stabbed just within the left nipple [10] He was in extreme shock with cold skin and barely palpable pulse Under ether anesthesia, blood was found to escape from a wound in the pericardium and an attack of paroxysmal ventricular tachycardia was observed There was also a penetrating wound over the left ventricle, one inch long which was grasped and sutured The patient recovered

There are recorded in the literature several such interesting cases Some of them are of stab wounds which required suture and resulted in complete recovery

Compensation Criteria

In considering the subject of trauma to the thorax with intrathoracic cardiovascular injury from the point of view of the compensability of the accident, several important criteria must be established

1 From a labor standpoint, the heart is healthy if a man is able for a long period of time to pursue his occupation without distress and without long periods of absence from work

2 If, following direct or indirect violence to the chest, signs of an intrathoracic cardiovascular lesion develop, which are incapacitating, they must be considered the result of an aggravation of a previously-existing asymptomatic lesion, or the result of damage to a previously normal heart

3 As in heart strain, the time that elapses between the accident and the development of disabling symptoms is very short There must be immediate pain with its concomitants—dyspnea, rapid irregular pulse, faintness, and cold sweat, and immediate partial or total disability in order that causal or aggravating relationship be clearly established Temporary improvement with return to usual or lighter work, followed by a recurrence of the condition may occur But, in these cases, the re-appearance of the symptoms and signs should be attributed to the original injury

Summary

1 The superficial position of the heart and pericardium directly behind the sternum and the adjacent cartilages exposes it to dangers from injuries to the anterior chest wall

2 With or without injury to the ribs, or even without obvious external bruising, an external blow may produce very serious damage to the intra-thoracic structures

3 The principal clinical types of traumatic heart lesions that occur in consequence of direct and indirect violences are classified

4 The pericardium may react to a contusion or concussion of the chest with the development of acute pericarditis

5 Auricular fibrillation may follow direct violence to the chest.

6 Extrasystolic arrhythmia may arise following damage produced in the cardiac tissue by direct injury to the organ from blunt violence such as blows to the chest, or indirect injury as in falling from a height

7 The location of the trauma in the myocardial structure will predicate the functional disturbances or arrhythmia that may develop Cases are reported of heart block from direct injury to the chest

8 Injury to the front of the chest, with or without injury to the ribs or even without obvious external bruising, may cause rupture of one or more of the valves in the heart

9 The mechanism of the production of such injuries is discussed

10 Illustrative cases are reported by the authors The most important clinical characteristic of these cases is the immediate development of physical signs referable to the valvular lesion

11 Besides injury to the aortic cusp, the wall of the vessel frequently suffers in accidents due to direct violence to the front of the chest, with the formation of a dissecting aneurysm

12 A pre-existing aneurysm may rupture in consequence of direct blunt violence to the thorax

13 A number of cases in the literature indicate strikingly that due directly to external non-pene-

feces and many groups of B coli gave positive fixation with her blood

It may be argued that there is an excess of B coli reactions in the above cases of arthritis (which is usually considered to be of Streptococcal origin) Four of them were patients who had been unsuccessfully treated with very complete courses of streptococcus vaccines by another physician and since they are doing well with vaccines made from the organisms indicated by our tests, we think that this clearly indicates that the above results are accurate

In addition to these, the following cases may be of interest Dr A F G had diabetes, duodenitis and arthritis His blood gave positive reactions to streptococci and Micrococcus catarrhalis The gall bladder was drained It was found to contain mucus in increased amounts and, when this was cultured, we obtained a pure growth of Micrococcus catarrhalis

Miss C C, who gave a history of having had dysentery, was found to have negative blood tests for the dysentery group but positive ones for C welchii and slight reactions for an occasional B coli group and for enterococci The stool showed non-toxic strains of B coli and a non-toxic strain of Aerobacter aerogenes This latter organism is usually extremely toxic and is found very frequently in kidney infections In view of this fact, it was interesting to observe the blood reactions to its group They were quite negative There was a moderate increase of C welchii in the stool and this finding, suspected from the positive blood tests was strengthened by the fact that the stool was very acid (pH 5 3) and was yellow Most infections by C welchii have an acid stool while those due to other anaerobes veer toward the alkaline side

Mrs C W M is an excellent example to illustrate that the electrophoretic index of toxicity is a constant one for each strain On January 7, 1929, her stool contained an almost pure culture of B coli with an index of 56 5 On April 5, 1929, it contained an almost pure culture of the same organism with an index of 58 Allowing for a slight experimental error, these results agree very closely The intestinal tract was not the primary focus of her infection It was subsequently found in the tonsils which revealed a pure culture of non-hemolytic streptococci Her blood was positive for streptococci but negative for B coli

Mrs W LeG had a diagnosis of cholecystitis The blood urea was 40 mg and the icterus index 17 The urine contained an occasional hyaline cast The stool was examined on May 11, 1928, but no bacteria were recovered on culture A small amount of mucus was present As will be pointed out later, this suggested a streptococcus infection of the duodenum On November 2, 1928, we isolated a few B coli of moderate toxicity but no other aerobes However, the anaerobic blood agar plates contained a large number of streptococci On April 5, 1929, a specimen of blood was submitted for bacterial complement fixation All antigens of streptococci gave positive results as also did typical B coli and hemolytic coli The patient was operated on April 11 and a culture of the excised gall bladder was negative Since she had been given considerable vaccine treatment based on our methods, we suggest the possibility that the inflamed gall bladder had been sterilized as a result of the treatment and that the pain in the upper right quadrant was due to the effect of the adhesions

Too little emphasis has been placed on strain differentiation in bacteriological diagnosis The labeling of a culture with a specific name is not sufficiently precise in view of the difference in toxicity of various strains in the same species This is particularly true of streptococci and B coli By means of improved cultural methods, the toxigenic index and bacterial fixations, we are now able to control bacterial identity with a nicety and accuracy which was lacking in older methods These studies suggest that secondary infections are often quite as important as the primary ones and that in a given case of colitis or arthritis we may be dealing with multiple infections This is suggested especially in some cases in which C welchii may entirely dominate the intestinal picture, bacteriologically speaking, and yet may produce no toxic symptoms whatsoever But when a toxic strain of B coli is present, which, by its toxic effect on the mucous membrane, breaks down this defensive mechanism, then welchii toxins are readily absorbed with resulting signs and symptoms Is it not logical also for us to draw the conclusion that a general lowered resistance paves the way for the invasion into the tissues of more than one group or strain of bacteria?

One of the most striking results of this research was the finding, in a small percentage of patients, of a relative absence of the usual intestinal bacteria from their stools These patients were repeatedly examined over a period of many months with the same results, proving that the phenomenon was fundamental with them No increase in bacteriophage could be demonstrated in their stools, and their gastric acidities fell within normal limits The source of the relative sterility was finally attributed to the duodenum These patients often gave strong complement fixation with streptococcal antigens but poor fixations were observed with the B coli groups We concluded that streptococcus toxin elaborated in the duodenum, was preventing the proliferation of B coli and other organisms Bacterial antagonism is a very important factor in intestinal bacteriology We have seen instances where Micrococcus catarrhalis streptococci and staphylococci in an infected duodenum had prevented the growth of B coli in the intestine We believe that the good results of proper implantation of B coli are due

due to the fact that all bloods contain varying amounts of a substance which will give positive results with any bacterial antigen If this substance is present in excess, all the results will be positive, if it is deficient, the results will be negative, if it is present in average amount, the results will be a little more reliable

Our method is to titrate this substance with a single antigen composed of aliquot parts of the entire 135 single antigens Some bloods will give negative results with this antigen, others will give positive results even if an amount of complement, equal to twenty times that usually employed, is used The amount of complement necessary to neutralize this tendency is accurately determined and is the amount employed in the test With these modifications, the test is similar to most standard methods We are at present attempting to adapt the technic to the Kolmer method

The value of this modified test is that, using antigens composed of various types of intestinal and other bacteria, we are able, with considerable accuracy, to determine which species of bacteria has invaded the body For instance, in a streptococcus infection of the intestinal tract, it is often impossible to demonstrate streptococci in the feces C welchii is quite constantly present in feces, but it is possible, by complement fixation tests in the patient's blood using these bacteria as antigens, to determine if he is harboring a toxic or a non-toxic strain of this organism

The results obtained by the electrophoretic test for toxicity previously described and by the modified bacterial complement fixation test using all the 27 antigens (for safety, we insist on using the entire series of every specimen examined) are remarkably consistent Examples of the application of these two tests are given below (table I) The term "corresponding antigenic group" refers to the stock antigen made from strains which are similar to the one mentioned as being isolated from the patient's feces For example patient G F L had asthma due to streptococci and even minute doses of this organism caused severe paroxysms No toxic strains of the B coli group were isolated from the feces On the other hand, Mrs J had mucus colitis due to B coli Many toxic strains of B coli were isolated from her

TABLE I

Initials	Bacteria Isolated From Feces			Bacterial Complement Fixation (Stock Antigens)		Clinical Diagnosis
	Type of B Coli Found	Index	Toxicity from Index	Corresponding Antigenic Groups	Other Groups Positive	
H E M	Atyp	46	Toxic	Slight	Streptococci	Phlebitis
Mrs J	Typ Atyp Atyp Wide hem	55 53 61 53	Moderate Moderate Doubtful Moderate	Moderate Strong Strong		Colitis
G F L	Typ Atyp	73 62	None Doubtful	Very weak Strong	Streptococci	Asthma
F B	Typ Wide hem	45 59	Very toxic Slight	Strong Moderate	Dysentery and Welchii	Colitis
Mrs P	Typ Atyp Aerog	80 109 82	None None None	Negative Negative Negative	Prot, Pyoc, Fried, G C	Gonococcus Arthritis

A S	Typ	46	Toxic	Moderate	Staph and Strep	Arthritis
Mrs C B	Aty Nar Hem Aerog	75 59 52	None Slight Moderate	Moderate Strong Strong	Most intestinal Bacteria (not Streptococci)	Arthritis
Mrs P A J	Typ	49	Toxic	Strong	Staph Alb (Strep neg)	Treated colitis (After successful dietetic treatment)
Miss C C	Typ	45	Very	Strong	Enterococcus Vir (S Vir Negative)	Arthritis and Colitis

lost in the smoke These injurious results are proven and are not debatable The only debatable part is when some one tries to put these losses in dollars and cents, but the cost remains very great, no matter how one calculates it. So far all have agreed What will we do about it?

The most important step in the prevention of smoke is the education of the public particularly as to the cost of smoke The new policy of enlisting the cooperation of civic organizations such as we have in New York namely, the Chamber of Commerce, Merchants' Association, Fifth Avenue Association, and some twenty others has been of invaluable aid If the members of every organization would eliminate smoke, it would aid greatly and perhaps almost entirely eliminate the problem

The education of engineers and firemen and others who burn coal is greatly needed A placard instructing in the method of stoking and firing is being distributed in all the plants It will show good results in a very short time There has been a great increase in the use of bituminous coal—about six times as much as was formerly used All bituminous coal smokes, some more than others There is plenty of anthracite, at but little more cost than a poor bituminous coal, but in those cases where great heat is desired quickly, it cannot be used except with a tremendous blowing apparatus which blows so many cinders out of the stack that it is worse than the dense smoke

Proper stoking and firing would reduce greatly smoke and soot, in some cases almost entirely, but, for home use, smokeless fuel should be used which eliminates smoke entirely, such as electricity, gas, coke and fuel oils It is simply a question of cost It must be remembered that if one were to use gas, for instance, this would eliminate the cost of delivering coal, and still further, the cost of storing it, also the cost of the removal of ashes

The law governing the discharge of smoke in New York City is as follows

Authority Charter

"Sec. 1168 The duty of the Board of Health is to enforce the law applicable in said district to the preservation of human life or to the care, promotion, or protection of health, and includes all laws relative to cleanliness, and to use all reasonable means for ascertaining the existence and cause of disease or peril to life and health, and for averting the same

"Sec 1172 Said Board of Health is hereby authorized and empowered from time to time to add to and to alter amend or annul any part of the said Sanitary Code The Board of Health may embrace in said Sanitary Code all matters and subjects to which, and so far as, the power and authority of said department of health extends, not limiting their application to the subject of health only

"Sec 1229 Definition—In the definition of the word nuisance are these words—"whatever renders the air unwholesome is a nuisance"

"Sec. 1887 A wilful omission or refusal of any individual, corporation or body to forthwith abate any nuisance shall be a misdemeanor"

SMOKE

Authority Sanitary Code

"Sec 211 Discharge of dense smoke prohibited—No person shall cause, suffer or allow dense smoke to be discharged from any building, vessel, stationary or locomotive engine or motor vehicle, place or premises within the city of New York or upon the waters adjacent thereto, within the jurisdiction of said City All persons participating in any violation of this provision, either as proprietors, owners, tenants, managers, superintendents, captains, engineers, firemen or motor vehicle operators or otherwise, shall be severally liable therefor

"Sec 212 Nuisance caused by the discharge or escape of cinders, dust, gas, steam, or offensive or noisome odors prohibited.—The owners, lessees, tenants, occupants and managers of every building, vessel or place in or upon which a locomotive or stationary engine, furnace or boilers are used shall cause all ashes, cinders, rubbish, dirt and refuse to be removed to some other place so that the same shall not accumulate, nor shall any person cause, suffer or allow cinders, dust, gas, steam, or offensive or noisome odors to escape or be discharged from any such building, vessel or place, to the detriment or annoyance of any person or persons not being therein or thereupon engaged

"Sec. 181 Misfeasance and nonfeasance—No person shall, knowingly, or carelessly or negligently, do or contribute to the doing of, any act dangerous to the life or detrimental to the health, of any human being, provided, however, that the foregoing provisions of this section shall not apply to a necessary act authorized by laws, nor shall any person omit to do any reasonable and proper act, or take any reasonable or proper precaution, to protect human life and health"

The Department of Health then is concerned with nuisances,—those conditions that are an injury to the health and comfort of the population In the matter of fire heat, so long as no nuisance is made the Department cannot be concerned as to what a person burns Hard coal, soft coal, or any other material, even garbage, provided no smoke, dust or odors are made, to the injury or annoyance of others So no law can be made against the burning of soft coal, because burned under proper conditions, it can be consumed without causing a nuisance, and any law prohibiting the use of soft coal, or any other

to the suppression of toxic strains in the colon by the metabolic by-products of the non-toxic strain Another example of this antagonism is noted in the changed intestinal flora in pneumonia which returns toward normal with an improvement in the patient's condition It is well known that in examinations of feces for typhoid bacilli, it is important to make the examination with the least possible delay since they are rapidly killed if left in situ The antagonism of L acidophilus and some putrefactive anaerobes needs no comment

It may be mentioned here that the reaction produced by the intestinal bacteria plays an important role in this antagonism Certain strains of C welchii and B coli produce a very marked acidity on a mixed diet

These studies have begun to open a new field for investigation They were applied in any case where it was necessary to find out if the intestinal tract contained a changed flora of a type that would be responsible for the patient's condition Obviously, this method of study can be applied in other directions It has given us valuable clues in searching for causes in some cases of diabetes, nephritis, mental disturbance, and especially where hidden foci were suspected

Conclusion

Electrophoresis and bacterial complement fixation have been applied to a study of the intestinal flora It is possible, by these methods to differentiate a normal from an abnormal stool The exact type of bacteria and, generally, the actual abnormal strain can be readily identified A combination of the two tests is very highly recommended in preference to either one alone The correlation and agreement between the two tests are remarkably close

SMOKE

By THOMAS DARLINGTON, M D , NEW YORK, N Y

THERE are a number of serious health problems which, though they have engaged the attention of health authorities and also the public, still remain unsolved Among these we find the control of the smoke nuisance By smoke I mean the visible passage of soot from chimneys and smokestacks usually caused by burning of soft coal In other words, it is that cloud that comes from a chimney and is composed principally of several gases carbon monoxide, carbon dioxide and several of the hydrocarbon series, besides sulphuric acid, ammonia, unconsumed carbon, and several other products The visible part is usually called "soot" Here let me make two observations First, that this is a problem that does not relate to health only, and secondly, that the enactment of a law does not and cannot always abate nuisances The continuance of the smoke nuisance is partly because of indifference of the public unless one is seriously affected, partly because of lack of study of the subject, and partly from lack of education

Why should we be interested in the smoke problem? What harm does it do? The harm is so well understood that it should not be the subject of controversy First, it is injurious to health It affects the eyes, nose, throat and air sinuses, lowering the resistance of these parts to disease It affects the respiratory tract and the bronchial tubes That the soot reaches these tubes is readily seen by the blackish mucus coughed up in the morning In the lungs themselves the carbon particles become imbedded, and in time the lungs change from their natural pink to a black color The irritation of the smoke and particles produces scar tissue and in time interferes with the normal action of the lungs

In addition to its effect on health, there is loss of sunlight with its violet rays, due to the screening of the sun by the smoke—particularly so on foggy days

It is needless for me to talk of the necessity and advantages of sunlight They are all too well known Hundreds of persons now purchase violet ray electric lamps to take the place of sunlight, the loss of which is due partly to smoke Of course our method of residing in dark apartments and our high buildings helps to shut off sunlight

The diminution of light increases the cost of living by making necessary more electric lighting Smoke increases the cost of living also through the increase of laundry and cleaning bills It depreciates home furnishings, such as carpets, curtains, furniture, books, etc , thus greatly increasing our cost of living To make ends meet we must, therefore, work harder, with less recreation and more irritation to our nervous system, thus shortening life

Smoke injures buildings The sulphuric acid soot eats into the stone, destroys the stone itself, and discolors it In some places smoke is destructive of real estate values Experiments have shown that smoke greatly injures vegetation, destroying trees and shrubs, in our parks and our highways, and seriously injures market gardens in the vicinity of a city, thus again increasing the cost of living Besides all this, one of the greatest losses is the unburned carbon

* Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N Y , June 5, 1929

person who accompanies him or her to the hospital. Sometimes additional information can be obtained from visitors who come in later

Physical Examination—A general, thorough physical examination is important. Special attention is paid to examination of the head, including a fundoscopic and otoscopic study A very complete neurological survey is also made The blood pressure is taken as soon as possible after admission and repeated at definite intervals

Laboratory studies should include the following items

1—Urine.

A study is to be made of a catheterized specimen obtained as soon as possible after admission

2—Spinal Fluid

The great importance of lumbar puncture in coma cannot be overestimated A study of the spinal fluid should include, physical appearance, amount, pressure, cytology, smear and culture for search of organisms and a chemical analysis for albumin, globulin and sugar, Wassermann where indicated, Colloidal gold where indicated.

3—Blood Examination A study of the blood chemistry is of the utmost importance, especially non-protein nitrogen and sugar Wassermann where indicated Other items for blood study may be investigated if indicated

4—Gastric Analysis A careful study of the stomach contents is very important, especially where there is a question of some form of poisoning

5—*X*-ray of the skull has been found to be a most necessary step, especially in the diagnosis of fracture of the skull

We believe that by following a definite routine in coma we can more often arrive at a correct diagnosis There is room for a more careful survey of various aspects of coma and we are following this routine for a time and hope to be able to make some valuable tabulations

Coma Routine

The following are illustrative cases of this routine

Case 1—Male, white, age 30-40 *History* Had been drinking heavily, then said to have had what resembled an epileptic seizure *Physical Examination* Deep coma Pupils dilated Breath smelled strongly of alcohol Pulse very rapid, poor quality Reflexes exaggerated *Urinalysis* Reaction acid Specific gravity 1032 Albumin four plus Microscopic Hyalin granular casts and numerous pus cells *Spinal Fluid* Bloody, all tubes *Blood Chemistry* non-protein nitrogen 43, sugar 145

Clinical Course—Thirty-six hours after admission the patient developed a flaccid paralysis on the left side Temperature rose to 106 and he died

Clinical Diagnosis—Cerebral hemorrhage

Autopsy—Revealed fracture of the skull, contrecoup laceration of the brain, cerebral compression, hypostatic pneumonia and fatty infiltration of the liver

Cause of Death—Fracture of the skull

Case 2—Middle aged male, white *History* Not obtainable *Physical Examination* Coma Odor of alcohol Cheyne Stokes respiration Lungs apparently clear Heart sounds of fair quality, no murmurs or enlargement Blood pressure 110/80 Abdomen negative, no masses Knee jerks active Arm jerks active. *Ophthalmoscopic Examination* Pupils widely dilated, do not react to light Bilateral choked disc *Spinal Fluid* Blood tinged, three tubes

Clinical Course—Developed Cheyne Stokes respiration and died one hour after admission

Clinical Diagnosis—Acute alcoholic poisoning

Autopsy—Subdural compression and subdural hemorrhage from spontaneous rupture of a dural vein Chemical analysis of brain negative for ethyl or methyl alcohol

Comment

The above cases are cited briefly to illustrate the importance of following the *coma routine* in detail In each instance, if the skull had been radiographed, a correct diagnosis would have undoubtedly been made

---

ACUTE INTESTINAL OBSTRUCTION*

By JOHN B DEAVER, M.D., PHILADELPHIA, PA.

The pleasure of addressing the Medical Society of the State of New York is greater than I am able to express in words, all the more so, since having previously had this privilege, I have a pleasant sense of familiarity in being with you again today

Intestinal obstruction, upon which your Secretary asked me to speak, is a far-reaching subject, and at the same time represents one of the most important acute abdominal conditions with which the surgeon has to deal This is particularly true, inasmuch as prompt decision followed by prompt action is demanded, if the best interests of the patient are to be served

* Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N Y June 5, 1929

material that does not create a nuisance, would be unconstitutional

The question of what is burned is largely a question of economy, whether coal, oil, gas, or other materials The question of the kind of fuel and the kind of furnace or smoke consumer, or any particular patent process, is a question for the individual owner, and his architects and engineers to decide, and not the Department of Health For a public official to decide such a matter is highly improper and illegal Yet such a plan was proposed!

A general revision of the code took place in the year 1899, and an absolute prohibition against the discharge of all smoke was put into effect On August 28, 1904, a Brooklyn manufacturer who had been arrested sued out a writ of habeas corpus which brought the validity of the ordinance before the Supreme Court in the Second Department Mr Justice Dickey, before whom the matter was argued, held the ordinance void, unreasonable and in restraint of trade, and said

"That part of the Sanitary Code of the City of New York which forbids any owner, lessee, tenant or others where business is run in the city to allow smoke to escape from such buildings, and makes it a crime to do so, is unreasonable, in restraint of trade and against public policy and void The mere permitting of harmless smoke to come out of a chimney cannot be made a crime Such an ordinance as this, if strictly enforced, would close every manufacturing establishment in this city It is well within the power of the Board of Health to prevent the use of soft coal or the burning of any noxious thing creating a nuisance or interfering with the health of the public, but this is no such ordinance"

Thereafter section 181 was adopted and the discharge of "dense smoke" prohibited Because of this decision it was believed to be the most practical method of dealing with smoke conditions in New York City A similar regulation had been sustained by the highest courts of other States

This decision would protect public health better if it would not consider smoke harmless and state that the Board of Health has the power to prohibit the burning of soft coal—both of which statements are, in my opinion, not scientifically or legally sound In New York City the problem is still further complicated from the fact that when the wind blows from the West—and it usually does—a considerable amount of smoke over New York comes from a neighboring state, over which we have no control It is hoped to remedy this through a Board composed largely of members of the Chambers of Commerce of both states

The Court of Special Sessions in the case of The People v The New York Edison Company, at the June Term, 1913, pronounced this ordinance unreasonable and invalid An appeal was taken to the Appellate Division of the Supreme Court, First Department, and the decision of the Special Sessions was reversed and the ordinance upheld

This opinion did not fully clarify the situation insofar as the court did not in the opinion lay down the law that dense smoke, no matter when or where emitted, is a violation of law On the contrary that when it is unavoidable or accidental or of a momentary nature, it would not be a violation of this section Therefore, each case must be decided by the court

The principal difficulty with the law as to its efficacy and enforcement and of obtaining convictions under it, is with the words "dense smoke" What is dense smoke? According to law, that which one cannot see through—opaque

While these words remain in the law, smoke cannot be eliminated entirely except through education of the owners of the buildings, tugs, engines, locomotives They must voluntarily control this nuisance, because of public opinion or love of one's neighbor

The solution of this great problem rests with scientific leaders in the field of engineering who must perfect appliances by which industry may burn any type of fuel without creating smoke And to this end the Commissioner of Health of New York City has requested the aid of scientists connected with Stevens Institue of Technology and New York University and other learned bodies, to lend their aid and assistance

A COMA ROUTINE

By LOUIS F BISHOP, JR, M D, and EMANUEL APPELBAUM, M D., NEW YORK, N Y

From the Fourth Medical Division of Bellevue Hospital, New York City

THE number of partially and fully comatose people admitted to Bellevue Hospital is unusually large They all afford interesting diagnostic points, and a rapid solution of the problem is often imperative It is with this idea in mind that we have undertaken the study of a large group from various angles

For some time we have felt that unless a systematic routine is followed in the investigation some very important items may be overlooked We believe that the following *coma routine* is simple and practical

History—The history has, of course, to be obtained from sources other than the patient It is important, therefore, to get as detailed information as possible from the relative or other

hesitate to operate in peritonitis with overlying muscular rigidity, while I may have some hesitancy in operating where the belly walls are soft and not under tension The peritonitis in the case under discussion, being an early one I immediately opened the abdomen under intraspinal novocain anesthesia I found both early peritonitis and partial obstruction, and was able to separate the adherent coils of bowel, two of which were acutely angulated with partial occlusion of their lumina I aspirated the pelvis obtaining puruloid material, smears of which were negative for virulent organisms Recovery was prompt and uninterrupted except for a slight wound infection The patient came to see me a few days ago saying how well she felt and how well able she was to look after her practice There is no doubt, in my mind, that without surgical interference the doctor would probably have perished

Incomplete obstruction may occur in paroxysmal attacks due to diverticulitis or recurring diverticulitis of the sigmoid In my experience, if the condition can be definitely recognized as an inflammation of a sigmoid diverticulum and is seen early, it should be treated conservatively, that is, by anatomic and physiologic rest There are certain conditions where conservatism is paramount and this is one of them, but in the majority of acute abdominal disorders radicalism will win out

In the experience of the Lankenau Clinic, and I dare say in that of other clinics, the most common cause of acute intestinal obstruction is adhesions The majority of these cases occur after operation, while the others follow a peritoneal inflammation from different causes This has occurred often enough with us to suggest to the surgical interns that when a patient is admitted with an acute abdomen, whose walls show a scar, the result of a previous operation, to think first of the appendix until it is ascertained that the scar is the result of an appendectomy, and then next to think of intestinal obstruction Should the operation not have been for the appendix, continue to think of the appendix until by examination it can be ruled out, then think of intestinal obstruction as well as prepare the patient for operation

Following any abdominal operation, no matter how simple, adhesions may and occasionally do occur They are met with in the way of strands, bands, and sheets adherent to neighboring coils or to a single coil of bowel to the parietal peritoneum at the site of the abdominal scar, to the great omentum, or to the mesentery beneath which a coil of small bowel may become obstructed These bands usually arise from attacks of local peritoneal inflammation, most commonly around the cecum and the appendix, at the site of an ulceration of the bowel, inflamed mesenteric glands, tubercular peritonitis, abdominal operations as already noted, operation for external herniae and injuries The size, length and attachment of these obstructive bands vary, and the location of the inflammatory focus to which they owe their origin determines the site of attachment They will be found between structures that by natural proximity have become adherent to the primary seat of inflammation, between two portions of bowel, between bowel and abdominal wall, bowel and mesentery, or between omentum, bowel, and other viscera Adhesions between the bowel and the mesentery or omentum are more likely to become attenuated forming a cord or cords so that strangulation of a loop of intestine is very apt to occur and an adherent epiploic appendage, the tip of the appendix, or a Meckel's diverticulum may simulate adhesions in causing obstruction

A tiny adhesion between two limbs of small bowel making a small aperture through which a coil of neighboring bowel passes is not an uncommon cause of obstruction, simply snipping the adhesion with the point of the scissors will release the obstructed bowel making the operation, if done early, of little moment An adhesion attached to the surface of a coil of small bowel opposite its mesenteric attachment may result in torsion of the mesentery and rapid strangulation of the bowel An adherent band, likewise, may become attached to the lateral wall of the bowel eventually resulting in the formation of a diverticulum and an arch that sooner or later, by angulation of the involved portion of the bowel, or incarceration beneath the arch, may cause complete obstruction A Meckel's diverticulum acts in the same manner in producing obstruction I could prolong this discussion on the freaky behavior of adhesions, but let these few examples suffice to show the important part they play in the etiology of acute obstruction The presence of multiple adhesions offers a more complex, and at the same time a more serious problem, sometimes requiring one or more anastomoses if extensive resection is to be avoided Surgery, for the relief of an acute obstruction caused by a single and small adhesion, may be likened to the surgery for a strangulated femoral hernia, that is, it must be done early in order to ward off gangrene of the bowel

Infiltration of a limited portion of the wall of the small bowel that lessens the size of its lumen and inhibits peristalsis, the most common example of which is a pelvic suppurative appendicitis is a factor in causing obstruction We often find the terminal ileum adherent in

Acute intestinal obstruction occurs as an obstruction of the blood-vessel circulation and of the fecal circulation, both of which are arrested, while chronic obstruction, as a rule, affects only the circulation or onward passage of the contents of either the large or the small bowel

Acute obstruction may be internal, external, acquired, congenital, or traumatic Internal obstruction, as its name implies, occurs within the peritoneal cavity so that the lesion is not evident to clinical inspection and can be located only after incising and opening the abdomen An external obstruction, the most common example of which is an external hernia, can be seen if it is looked for I make this reservation because I am occasionally asked in consultation to see a supposed internal obstruction, and on examining the sites of the hernial orifices, find a strangulated hernia Therefore, I say before making a diagnosis of internal obstruction always examine the hernial orifices With this statement, except to say that when a strangulated hernia is believed to have been reduced because the swelling has disappeared, an example of reduction en bloc, and the symptoms and signs of obstruction are still present, the abdomen should be opened at once I shall dismiss the subject of hernia and proceed to the discussion of internal obstruction

While internal obstruction may be congenital or traumatic, it is usually acquired, its causes in their order of frequency being adhesions, bands, peritoneal sheets, infiltration of the bowel wall, intussusception, incarceration in a peritoneal fossa, passage of a loop of bowel through the foramen of Winslow, a congenital or an accidental hole in the great omentum, in the mesentery, or in the meso-colon, twist or torsion of the great omentum, of the mesentery, or of the meso-colon, or by foreign bodies and pressure from without

Thrombosis of the mesenteric arteries may lead to acute symptoms closely resembling those of acute intestinal obstruction, while a venous mesenteric thrombosis will mimic the more chronic type of obstruction Very few cases are reported in the literature, those that are described were diagnosed at laparotomy and all of them were fatal

Although intestinal obstruction is usually complete, it may be incomplete or intermittent as in peritonitis due to an inflammation of the appendix, or of a Meckel's diverticulum, or in diverticulitis and recurrent diverticulitis of the sigmoid The last named is a rare example of incomplete non-mechanical obstruction of which I have seen an example It may be the result of disturbance of the sympathetic nervous system, or inhibition of nerve action by trauma in connection with a deep infection of the abdominal wound after an extensive operation In either case the condition corrects itself in a few days If caused by wound infection it subsides after the wound has been widely opened and drained, and when due to trauma of the nerve supply after an extensive and prolonged operation, it also subsides spontaneously In either case the anxiety of the surgeon is increased until there is evidence of a change for the better I have often been worried in these cases, but the absence of the characteristic pain of mechanical obstruction—nausea or vomiting, and stormy peristalsis—have been reassuring These cases may be classed as pseudo strangulation Marked, and occasionally persistent abdominal distention is sometimes seen after removal of a kidney through an extra-peritoneal approach This is another example of nerve disturbance, the explanation being that the abdominal walls are supplied by certain dorsal nerves from the trunks of which are derived the spinal nerve contributions to the splanchnic trunks, and the latter, as we all know, share in the formation of the great abdominal sympathetic plexus This explains the arrest of peristalsis sometimes occurring from irritation of the skin Incidentally, I may say that maintaining and increasing the abdominal temperature by diathermy during and after the operation will help to prevent this occurrence

Intermittent, incomplete obstruction, as occasionally seen in postoperative peritonitis and in peritonitis caused by appendicitis, a Meckel's diverticulum or a sigmoidal diverticulum, presents the questions (1) diagnosis of obstruction, and (2) the advisability of operation for relief of the obstruction, upon the correct solution of which may hang the fate of the patient I have, upon more than one occasion, had to decide this question In fact, comparatively recently, this arose in the case of a friend after operation for the release of very extensive adhesions following a pelvic operation done several years before. The patient, a doctor, apparently was getting along very nicely for two days when she developed inability to pass gas, frequent paroxysms of abdominal pain, nausea, increased temperature and pulse rate, a moderate leucocytosis and increased polynuclear count, diffused tenderness and rigidity, hyper-active, stormy peristalsis around, and hypo-peristalsis over the area of involvement These signs and symptoms influenced me to conclude I was dealing with an early peritonitis, since the muscles overlying the peritonitic area were rigid, and partial obstruction, the result of adherent coils of small bowel Muscular rigidity is the accompaniment of early peritonitis as against muscular relaxation or at least more or less flexibility of the muscles, in late peritonitis In passing, I may say I rarely

ing the dictum,—instead of watch and wait,—look and act

Obstruction at the site of one or other of the peritoneal fossae is rare, in my experience at least, although we have occasionally seen it in our clinic The peritoneal fossae owe their importance to the fact that by gradual enlargement they may harbor the greater part of the movable small intestine leading to the formation of an intra- or retro-peritoneal hernia The most important of these fossae are the duodeno-jejunal, the intersigmoid and the fossae around the cecum, namely the ileocolic, superior ileo-cecal, the inferior ileo-cecal and, finally the most important,—the subcecal or retrocecal fossa, due to the fact that it often is the site of the appendix When an inflamed appendix occupies the retrocecal fossa, the peri-appendicular inflammation occasionally results in occlusion of the orifice of the fossa, this being one of the reasons for believing the appendix to be congenitally absent Incidentally, I may say, I have never met with this congenital defect, although I have occasionally thought of it until I opened the closed-off fossa to find the appendix located therein Primary and residual appendiceal abscess, the latter the result of a retained fecal concretion does occur here

If the mouth of the retrocecal fossa were small, which it rarely is, it could be readily seen how a knuckle of small bowel might become incarcerated or strangulated In a few cases of obstruction (bearing in mind the role these fossae sometimes play in intestinal obstruction), in searching for the site of strangulation, it is not uncommon to have to disembowel in order to be sure that the site of the obstruction has not been overlooked

A danger point is an unusually large intersigmoidal fossa in the angle formed by the horizontal and vertical limbs of the sigmoid mesocolon When strangulation occurs at one or other of these points, it is not always possible to determine the exact position of the peritoneal pouch at the time of the operation

High intestinal obstruction, as instanced by hernia through the foramen of Winslow, constitutes one of the most formidable examples of acute obstruction I have seen practically all of the upper small intestine occupy the lesser peritoneal cavity, it having entered the cavity by way of an abnormally large foramen, with strangulation of the afferent and efferent limbs by the margins of the foramen Needless to say, the diagnosis of this type of lesion is not made clinically, although I recall at least one instance where due to persistent vomiting, together with an epigastric swelling and extreme tenderness, short respirations, rapid pulse lividity, the condition was thought most probably to be acute pancreatitis, but at the same time, the very severe pain, stormy peristalsis over the area normally occupied by the stomach, raised the question of obstruction The patient was immediately operated upon The diagnosis was confirmed and recovery followed

Sometimes, as the result of an antecedent accident, a slit is produced in the mesentery, through which a loop of bowel slips and becomes strangulated The opening in the mesentery, however, may be congenital I have seen acute obstruction of this origin Not long ago a man was brought to the clinic in a dying condition from obstruction Post mortem showed a strangulated and gangrenous knuckle of small bowel engaged in a congenital hole in the mesentery of the ileum The history showed that he had had one attack somewhat similar to the fatal one, but which had relieved itself spontaneously At operation, if a congenital hole is found in either of the mesenteries, it should be closed, also openings accidently made in the great omentum during manipulation, especially in freeing the adherent omentum

An operation for volvulus of the sigmoid which I have devised and have already reported, is anastomosis of the roots of the limbs of the sigmoid This can be done only before gangrene has occurred and where reduction of the twist is possible I have now performed this operation often enough, and without a fatality, to recommend it, believing as I do that it will prevent a recurrence If one contemplates subsequent removal of the redundant sigmoid the secondary operation is made much safer, and in our clinic has given good results

These are all clinical entities, more or less common, but which cannot always be differentiated clinically The diagnosis of obstruction, however, should not be difficult to make

Acute intestinal obstruction always begins with pain and is always followed by vomiting, the character of the vomitus being pathognomonic It is so significant that even to the less experienced observer, when it occurs in the presence of acute intermittent abdominal pain, together with inability to pass flatus, there should be little doubt about the diagnosis of acute obstruction Following the onset of the pain there is nausea, and if the obstruction is not soon relieved vomiting occurs The vomitus at first consists of gastric contents and in a short time is followed by regurgitation of duodenal contents and later of the contents of the upper small intestine Vomiting occurs earlier and is more persistent in high than in low obstruction

When there is some doubt as to the char-

the pelvis so acutely angulated as to cause obstruction, in which on account of the density of the adhesion and the softened bowel wall it would not be wise to release the attached bowel for fear of tearing it, thus necessitating resection under most unfavorable circumstances Immediate relief and future safety are best attained by anastomosing the normal bowel proximal to the infiltrated portion, preferably to the cecum or to the transverse colon close to the hepatic flexure Also when the terminal ileum forms a part of the wall of a pelvic abscess and is so infiltrated as to render it stiff and functionless, an anastomosis, as just described, assures against immediate or remote and possibly fatal obstruction and makes for an early, smooth convalescence Prompt action prevents early as well as late obstruction When the latter occurs, as it often does, the medical consultant, who if he has not seen similar cases and does not know the fatal risk of delayed operation, is called and, as a rule, advises trying remedies that not only cannot possibly do any good, but stay the surgeon's hand, until he finally awakens to the fact that operation must be performed By this time the patient has only a minimum chance to get well, as the toxemia has placed him almost, if not entirely, beyond the realm of a surgical recovery This, I consider, a pitiful and unjustifiable blunder, placing the surgeon in a most uncomfortable and embarrassing position and robbing the patient of his best chance to get well

Infiltration of the terminal mesentery of the ileum following extension of an appendiceal inflammation may cause obstruction several months after the attack of appendicitis, due to foreshortening of the mesentery, contraction and acute angulation of the ileum I have seen this often Just within the last several days I have operated on such a case where the appendix had not been removed at the primary operation, thus leading to the correct interpretation of the pathology causing the obstruction

The behavior of exudates that subsequently form adhesions, bands, and membranous peritoneal sheets is truly remarkable Those of us who have made many thousands abdominal operations know this only too well They are sometimes truly freakish causing intestinal entanglements that are both embarrassing to differentiate and difficult to disentangle

Another perplexing condition sometimes encountered and closely resembling the bowel in appearance, is cystic degeneration of part of the great omentum forming part of the obstructive mass Under these circumstances, I have seen the surgeon staggered, when, after having opened the cystic omentum he was unable immediately to decide whether or not he had opened the intestine

I hope that detailing these experiences may be useful to some of you who have not yet met with this and similar anomalies It is oftentimes difficult to interpret the real state of affairs in obstruction in the presence of partial descent or incomplete rotation of the obstructed bowel or in cases where the large bowel has an incomplete peritoneal covering These are difficulties which add to the surgeon's responsibilities It also emphasizes the value of a large experience in surgical work The late Dr David Hayes Agnew, remarked on one occasion that after having practised surgery for more than fifty years he wished he could live twenty-five years longer for then he might be of some use to his patients

I need say little of intussusception, which occurs mostly in children, and is generally well understood The diagnosis, with few exceptions, if one has this in mind, is not likely to be overlooked At any rate, when called to see a child seized with acute, intermittent, abdominal pain, abdominal rigidity, vomiting, tenderness, and is passing blood and mucus by bowel, intussusception should first be considered The presence of an abdominal tumor cannot be made out in all cases, neither by abdominal nor by rectal examination, except in late cases Operation is the indicated treatment, but this is often deferred in favor of a trial of expectant treatment, a disastrous decision, as there is little to expect from it but death Early operation, in the majority of cases, permits of reduction, while late operation will demand bowel resection which too often spells fatality Two conditions that are often confused with intussusception are gastroenteritis and acute, fulminating appendicitis with diarrhea

Acute obstruction occurring during convalescence from a previous abdominal operation, usually after an acute appendicitis, in our experience is not very unusual In the Children's Hospital of the Mary J Drexel Home, my brother, Dr Harry C Deaver, and myself, have had one series of thirteen such cases all of which recovered. Operation was made immediately after the appearance of the following symptoms and signs onset of acute paroxysmal pain, nausea, stormy peristalsis, absence of flatus In all of these the findings were either constriction by an adhesive band or an adherent coil of bowel Recently an intussusception occurring three days after an operation for gangrenous appendicitis in which, needless to say, immediate operation for the obstruction was followed by recovery These results argue for immediate opening of the abdomen in the presence of suspicious symptoms and signs even in the absence of absolute certainty as to the diagnosis, support-

of peristalsis is typical Hypoperistalsis, on the other hand, while it indicates that the most active part of the storm has abated, tells us that its remote effects are still present in that the condition is rapidly going on to complete obstruction and, if operation is not made, to peritonitis, bowel paralysis and toxemia, followed by the absence of peristalsis or the silent belly, the omen of death If what I have just said is true, is not auscultation of great value in diagnosis?

Locating the site of the obstruction at operation is usually not a difficult matter, although at times there may be some trouble in doing so

In the Lankenau Clinic it is our practice, which I take it does not materially differ from that of other clinics, after opening the abdomen first try to locate the coils of collapsed bowel and when found to follow the collapsed bowel to the site of the obstruction It is when the intestines are markedly distended that there is difficulty When the collapsed bowel is not readily found we immediately eventrate the small intestine, enveloping the intestine with large moist pads wrung out of hot saline solution In this way only a few minutes will be required to expose the site of the obstruction after which the intestines are replaced and the obstruction relieved The use of diathermy during operation is beneficial

In the attempt to empty the distended bowel, we very rarely find it necessary to make an enterostomy, which, of course, adds materially to the risk of infection Neither do we make a permanent enterostomy, leaving the obstruction to be dealt with at a second operation Our aim is to complete the operation at one sitting This practice we have found to be successful Piece-meal surgery in this class of case, has never appealed to us This may not be in conformity with the practice of other surgeons, but with us it has been satisfactory Milking the intestines to empty them through an enterostomy opening is apt to be followed by that bugbear,—gangrene. This practice causes mottling of the intestine due to foci of bleeding beneath the serosa, which invites gangrene

In speaking of enterostomy I wish to include jejunostomy The difficulty of draining bowel which has lost the power of contraction is very great No method is entirely satisfactory In the Lankenau Clinic, we believe we get the best results with the duodenal tube or the jute tube carried into the stomach through the nose By retaining either of these tubes for some time we get satisfactory continuous drainage of the upper intestine We have, on occasion, kept the jute tube in for three or more days, having it aspirated and irrigated with warm saline solution I realize that those who practice jejunostomy or enterostomy usually do it only in late cases and the results are notoriously bad, the patient dying of starvation and toxemia As in other clinics, we also give gas bacillus serum but our results thus far have not been encouraging. In the cases of the paretic bowel in which the differential diagnosis between the toxemia of obstruction and of late peritonitis is impossible, anti-gas or the Welch Bacillus serum is being advocated by some surgeons In the Lankenau Clinic, our experience has not been large enough to warrant a definite expression of opinion as to its value The reason we do not use the serum more often is because of our good results in operating obstruction cases early and in treating our peritonitic patients by anatomic and physiologic rest, and with continuous drainage with the jute and duodental tubes supplemented in some instances by lavage Neither jejunostomy nor the gas bacillus serum can take the place of timely operation, which I feel it my duty to advocate with all the force I possess Stop hair-splitting diagnoses in questionable cases and open the abdomen I admit that study of the blood chemistry,—the state of chlorides, etc, is essential in a certain type of case but it can not replace timely operation

Since study and experimental work, especially that of Orr and Hayden, have demonstrated the importance of alkalosis as a clinical entity and as a postoperative phenomenon, the subject has naturally attracted attention It is a well-known fact that one of the causes of the condition is high intestinal obstruction particularly in the duodenum or at the pylorus It may be either preoperative or postoperative The syndrome is a combination of that of shock and uremia, but the dominating sign is tetany There is marked tremor or tetany, dehydration, marked increase in hemoglobin and red blood corpuscles, vomiting of watery bile-stained fluid, low blood pressure, asthenia, increased urea nitrogen and creatinin, albuminuria, casts, and a very marked rise in the carbon dioxid combining power of the blood and a consequent decrease in blood chlorides

The first and important thing in these cases is to relieve the obstruction by surgical means, after which acid therapy is indicated, consisting of hydrochloric acid by mouth and increasing free chloride ions by giving calcium and ammonium chloride per rectum

This condition should be kept in mind in postoperative intestinal obstruction, and since it can be diagnosed only by carbon dioxid estimation, it is obvious that this test should be frequently made in order to make an early diagnosis so that suitable treatment can be instituted early and a fatal outcome possibly avoided

acter of the material vomited it is the practice, in our clinic, to drain the stomach with a jute tube carried through the nose where it is retained and aspirated at frequent intervals, and if dark, foul smelling material is obtained, immediate operation is indicated Very often a nurse and occasionally an intern, especially if he has just come on the service, when told to wash out the stomach or introduce a jute tube will be surprised and tell you the patient has just vomited, and inspection will show a bulging, prominent epigastrium not unlike the fullness of the hypogastrium that indicates a distended bladder, notwithstanding the fact that the patient is passing urine In the case of the former, the introduction of the stomach tube will be followed by the outflow of a large amount of material, and in the latter introducting a catheter will drain off a large amount of urine I have frequently made a tentative diagnosis of obstruction of the bowel as well as of the neck of the bladder by this simple practice I believe such simple means of making a diagnosis are often quite successful and certainly are worthy of keeping in mind

Inspection of the abdomen in acute obstruction does not, as a rule, give us the same valuable information as in chronic obstruction where the outlines of individual dilated coils with the peristaltic waves as they pass along give the ladder-rung appearance to the anterior abdominal wall If, in such an abdomen, peristalsis is quiet at the time the examination is made, palpation will excite an attack of pain following which one can often see the outlines of coils of bowels and, furthermore, with the hand in contact with the surface of the abdominal wall, the coils of bowel can be felt alternately hardening and softening These signs are so characteristic of the condition as to warrant a diagnosis The only type of acute obstruction, on the other hand, where inspection always reveals valuable evidence is in the case of an acute obstruction supervening upon a chronic obstruction

We must not lose sight of the fact that the very early symptoms of acute, primary intestinal obstruction are common to those of other acute abdominal conditions, in that the pain is first referred to the epigastrium, for example, as in acute, perforated, peptic ulcer, acute pancreatitis, fulminating, perforative appendicitis, acute phlegmonous fulminating, perforative cholecystitis, lead colic, food colic, etc

Paroxysmal pain, however, is more suggestive of obstruction The point of reference of the pain is not always in the epigastrium, but it may be at the site of the obstruction at which point there will be muscular rigidity and marked tenderness to palpation I have noted this in a small percentage of cases, but the distinction is not often made except by a very intelligent patient, more particularly if the patient is an experienced medical man While we are apt to be reluctant to be influenced by such an unusual statement, this observation has, in several cases, influenced me to open the abdomen directly over the point of reference and to find the site of the obstruction

Distention appears later in high than in low obstruction, with the exception of acute volvulus of the sigmoid, which if pronounced, always more or less befogs the picture Therefore, he who sees the patient very early has an advantage of the consultant who, I regret to say, usually sees the patient late Marked distension makes for a less favorable surgical prognosis

Palpation in acute obstruction ordinarily reveals little Percussion is of more moment, especially early in the case before there is general distension, for then one or more coils of distended bowel may act as a guide to the probable site of the obstruction In the very late case, where peritonitis has entered upon the scene, palpation and percussion will detect fluid, a finding which is more useful in making a prognosis than a diagnosis Digital examination of the rectum shows ballooning

Auscultation I regard of great value in the diagnosis of obstruction and incidentally, I may say also, in the diagnosis of the different varieties of peritonitis I have always stressed this in teaching students In the diagnosis of abdominal diseases auscultation is of as much importance to the surgeon as it is to the physician in the study of chest diseases I fear, however, the physician is in danger of losing this art as he now depends so much on the *x*-ray While the value of the latter is unquestioned, we must not lose sight of the value of auscultation and of the aspirating needle in conditions of the chest Don't let us give up man power for machine power The same applies to *x*-ray study of acute obstruction I have not lost faith in the superior value of the use of our especial senses in diagnosis It was said of the late Dr J M DaCosta, a noted Philadelphia diagnostician, that he could hear the echo of a rale Present-day methods cannot eclipse, if equal, the attainments of such men

Auscultation enables us to distinguish the different types of peristalsis,—normal—hyper—hypo—or its absence or merely the tinkling, so suggestive of beginning bowel paralysis In the absence of peristalsis and when only tinkling is heard, the pulsations of the abdominal aorta are abnormally loud Early in acute obstruction there is stormy, tumultuous, hyperperistalsis occurring in waves, starting suddenly and ending abruptly, resembling ocean waves during a severe storm This type

You will note that this regulation applies to all reportable diseases except chancroid, gonorrhea and syphilis—and that its application to tuberculosis is limited to a slight degree

We wish at this time to call attention to diphtheria in connection with this regulation

The Report.—When you receive a report of a case of diphtheria, see that it is sent to Albany AT ONCE, *don't hold any reports until the end of the month* But be sure that the report is *complete* Note the question, "Had patient received toxin-antitoxin?" See that this question is answered, if the reporting physician has neglected it, use the telephone and find out about it, and fill in the answer yourself

The Diagnosis —It is "up to" you to satisfy yourself as to the correctness of the diagnosis A positive culture alone does not settle a diagnosis, neither does a negative one alone do so Take into consideration all the evidence. The effect of antitoxin is a very valuable piece of evidence.

The Investigation —See that the case is really investigated Filling out an investigation card does not necessarily mean that a case has been investigated at all Some of the work done along this line should not be dignified by the term "investigation" at all—it's only filling out a card Pertinent information along certain lines is needed, not merely something to fill spaces on a blank

As we have stated on several occasions, visits are made to cases of communicable disease for several definite purposes

1 To secure data from which to determine the source.
2 To ascertain to whom that case may have already communicated the disease — the contacts
3 To instruct in regard to preventing further transmission

The Date of Onset —This is the most important factor—the one upon which the entire investigation depends *Never accept the reported date of onset without inquiring as to its correctness*

If you have a nurse who appreciates the value of securing the true date of onset and then knows how, by taking into consideration the maximum and minimum periods of incubation, to estimate the period during which the infection must have been received, you are in a position to do real communicable disease work Right here, however, it is only fair to say that some health officers should polish up their ideas along this line

THE PSYCHIATRIC ASPECT OF DRUG ADDICTION*

By MOSES KESCHNER, M D, NEW YORK, N Y

IT was not until the close of the last century that it became apparent that descriptive psychiatry was inadequate as a method of approach to the proper understanding of individuals afflicted with mental disease At this time it began to be realized that the mentally ill must be studied from the points of view of constitution and personality, and that their symptoms must be subjected to interpretative and analytic investigations

The study of the psychiatric aspects of drug addiction is just beginning to emerge from the descriptive stage and the psychologic interpretation of the various mental manifestations of this disease is beginning to prepare the way to a genetic approach to the problem Efforts are now being made to understand the drug addict by studying his reactions and behavior, because a proper appreciation of these also sheds light on character and habit formation Human behavior, character and habit formation cannot be understood without the aid of genetic and dynamic psychology which considers man a biologic unit unceasingly adjusting himself to his environment in a manner most adaptable for developing and expressing the energy and strivings within him

Dynamically our entire mental life is a series of reactions to stimuli derived either from within or from without The selection of the particular reaction is based upon laws which govern all body activity In other words, given a certain stimulus, the reaction that follows is one which promises, in the light of experience of the individual, to offer the most favorable opportunity of securing satisfactory adjustment according to the fundamental laws of the maintenance of life There are several such types of reaction, of these the emotional type is perhaps one of the most important, because it represents a very vigorous adjustment of all the effector mechanisms of the organism towards meeting some particularly momentous situation The more important biologically the situation, the more prompt and decisive must be the reaction Many of these emotional adjustments may be primitive in nature and inseparable from the situation

*Read before the Eastern Medical Society April 12 1929

The mortality of acute intestinal obstruction is high—entirely too high,—the chief reason being late diagnosis and late operation The early symptoms and signs of acute intestinal obstruction have not been sufficiently stressed, particularly in the older text books, and I regret to say at the present day, not always either by the spoken or the written word Fecal vomiting should not be regarded as a sign of acute intestinal obstruction, but the sign of the end—result of the obstruction,—death The early symptoms, if not also the signs of early acute obstruction are familiar to most of us but the question is, are most of us sure enough to advise immediate operation? Naturally he who has had a large experience in active and in consultant practice should have little hesitancy in arriving at a decision To the less experienced, especially the practitioner in rural districts with limited opportunity for seeing such cases, the decision will not be so easy, unless he has been fortunate enough to have served his internship in a busy clinic and has remembered what he there learned

Time has not permitted considering every phase of so wide a subject as acute intestinal obstruction I have tried to call attention to the more common types of the disorder and some of the difficulties it presents If I have succeeded in clarifying a few obscure points and in interesting you, I shall feel well satisfied

DIPHTHERIA PREVENTION

The number of recorded anti-diphtheria immunizations in the counties of Sullivan, Ulster, Orange and Rockland for the first six months of the year 1929 is shown in the following table

	Ages					
	1-4	5 9	10 14	15-19	20-ov	Total
Sullivan	287	348	237	62	6	940
Ulster	414	374	170	11	5	974
Orange	1,291	1,086	507	69	4	2,957
Rockland	441	829	305	23	10	1,608
	2,433	2,637	1,219	165	25	6,479

Considering the work previously done, the foregoing record is one to which the West Hudson District can "point with pride" But it is imperative for the work to continue

Look at the record of births for the first six months of this year

Sullivan	214
Ulster	573
Orange	903
Rockland	454

If we expect to hold the advantage we now have over the disease, more children must be treated, and don't wait until next spring

No other public health activity of modern times has shown the value of health officers, so well as the work of diphtheria prevention Nothing has done more to separate health officers, in the mind of the public, from the inspection of rubbish heaps and the burial of dead dogs And yet occasionally a health officer asks, "Do I have to do this T-A work?" Ye gods and little fishes!

Start the nurse rounding them up now and make the record of the district for the last six months as good as the first.

* * * *

Every health officer in the district should read and meditate upon, and then proceed to carry into effect, Regulation 13 of the revised Chapter II of the State Sanitary Code So as to save you the trouble of looking it up, we are giving it here

"It shall be the duty of the health officer, either personally or through a qualified representative, immediately upon receiving a report of a case of communicable disease, other than chancroid, gonorrhea, or syphilis, or as soon thereafter as possible

(a) To make such an investigation as the circumstances may require for the purpose of verifying the diagnosis, ascertaining the source of infection and discovering contacts and unreported cases,

(b) To collect and submit, or cause to be collected and submitted, for laboratory examination such specimens as may furnish necessary or desirable information in determining the source of infection or to assist in diagnosis,

(c) Except in tuberculosis, to give to a responsible member of every household living in the building in which such case exists or was taken sick, such appropriate circular as may be issued or approved by the state commissioner of health,

(d) To assure himself that proper bedside disinfection is being employed, to instruct a responsible member of the household of the means to be taken to prevent further spread of the disease and to put into effect those other recognized measures which tend to reduce morbidity and mortality"

From the Health Officers' Bulletin of Dr F W Laidlaw, District State Health Officer

morphinism very little failure of memory, although diminished attention, incoherence of ideas and easily fatigued intellectual capacity are not uncommon

In chronic cocainism there also occur incapacity for mental application, great irritability and restlessness, impaired judgment, and at times delusions, especially of marital infidelity These symptoms may be followed by confusion with hallucinations, but more characteristically by a paranoid state It is well to remember that in cocainism the abstinence symptoms (headache, nausea, vomiting, loss of appetite, diarrhea, tachycardia, hypotension, diminished secretion of urine, abdominal and muscle cramps, restlessness and insomnia) are not as severe as in morphinism, and may not appear for several days when there sets in a profound depression, tearfulness, moaning and sighing with general demoralization The persecutory delirium may persist for a long time and render the addict a very dangerous individual

The relation of drug addiction to crime has recently been intensively investigated by Lawrence Kolb This author's conclusions, in complete accord with our own personal experiences, are that opium and heroin inhibit aggressive impulses and therefore make psychopaths less likely to commit crimes of violence Kolb also finds that cocaine, up to a certain point, makes criminals more efficient as criminals, beyond this point it brings on fear and delusions during which the addict might murder a supposed pursuer Inasmuch as libido and potency are usually partially or completely abolished in drug addicts sexual delinquencies are rather rare except for homosexual expressions of regression and narcissism

Looking at drug addiction from the points of view as discussed above, the indications for rational therapy are clear-cut and definite To meet these indications successfully is not a one-man' job The therapeutic problem demands 1 The necessity for more than ordinary care in prescribing habit-forming drugs in the daily routine of medical practice. 2 The necessity for individualization and good medical judgment during the period of withdrawal, in the attempt to overcome the deleterious effects of the respective drug on the somatic components of the organism 3 The necessity for treating the addict for his habit—for his craving for the drug This phase of the problem presents the greatest difficulties, because the approach to it must be wholly psychiatric and educational Fourteen years of clinical experience with drug addicts has convinced me that there exists no 'short cut" therapeutic method by which these individuals can be 'cured of the *habit*" If our conception of the pathogenesis of drug addiction is true the fallacy of employing medicinal agents to overcome the habit is obvious The treatment from which permanent success can be expected must be one of re-education and re-habilitation In this connection it may be recalled that very recently Light and Torrance have shown that morphine addiction, contrary to the general opinion, is not characterized by impairment of physical fitness aside from the addiction per se Except for a slightly lower hemoglobin and red blood cell count and slightly higher figures for cholesterol and lactic acid in the blood serum, drug addicts do not differ materially on the physical side from normal individuals These findings, if confirmed, are of the greatest significance because they indicate that when it will be possible to relieve the drug addict of his craving for the drug, complete rehabilitation may be expected

itself, in which case the modes of reaction are provided by inheritance, or they may be acquired as a result of the individual's experience through changes in the environment, and since much of this is hostile a constant struggle during the process of adjustment is inevitable

The mental equipment of man has evolved in such a way that the whole experience of the individual becomes a determining factor in his reactions There is a strong tendency for certain modes of reaction especially those established by the individual's experience to become standardized, or habitual We must, therefore, recognize that there is going on within man a constant organization of his experiences of situations and of his reactions to them with the tendency to establish more and more definitely certain habits of adjustment

Obviously habit formation is greatest in the earliest years of life Because of plasticity at this age, children's personalities can, by early training and proper guidance, be moulded and remoulded and have healthful habits easily inculcated in them, and it is during adolescence when the instinctive and emotional cravings seem to be at their greatest height that both of these must be sublimated along well established and socially approved channels

Viewing life in this light the importance of studying each individual as a complete personality by determining his views, fears, reactions, cravings and desires becomes self-evident Investigations of personalities of drug addicts along these lines show that the addiction represents a substitution or compensation for thwarted desires or ways out of annoying and unpleasant situations—it represents an escape from reality and from the disagreeable conflicts and struggles of life

For clinical purposes drug addicts may be divided into two groups 1 Those who become victims to a physician's prescription in the course of a painful somatic or mental illness, or for insomnia 2 Individuals who drift into narcotism because of bad company, pleasure, curiosity, desire for a thrill, or because they are unable or unwilling to face individual problems, difficulties, disappointments and defeats These constitute by far the largest number of drug addicts The individuals in this group are inherently mentally unstable, especially in the emotional sphere They represent the various types of constitutional psychopathic inferiority They are, as Haviland says, "persons in the twilight zone of mental ill-health" Some of them have a tendency to outbursts of excitement and abnormal behavior, or to fits of depression after the most trifling annoyances Individuals with this type of personality being unable to give an outlet to their extraordinary psychic tension in a spiritually productive way, take refuge in drugs which by obtunding their finer inner feelings relieve their pathologic tension Possessed of abnormal powers of imagination they live in a world of phantasy, in which they forget the past and think hopefully, or not at all of the future They are motivated almost entirely by the desire of the moment and are unable to follow any sustained plan of thought or action They have no regard for the truth and resort to all kinds of deceit, especially in their efforts to obtain their necessary habit-forming drug Although most of these personalities are congenital, here and there one encounters a case that has been acquired following some organic cerebral disease or intoxication The congenital as well as the acquired types constitute the so-called "misfits of society" from whom there is recruited the vagabond, the chronic alcoholic, the drug addict, the drug peddler, the habitual criminal and the sexual pervert

Metallic and endogenous poisons produce their baneful effects primarily on the physical organism, the mental effects being secondary Narcotic, or habit-forming drugs produce degenerative effects primarily on the mind and on character, they disturb normal reflex activity in both the sensory and psychic spheres Because of the overwhelming dependence of the instinctive and emotional life on a properly adjusted vegetative, endocrinous and neuronic functioning, chronic disturbances of these, induced by the prolonged use of narcotics, sooner or later interfere with all bodily activities and produce more or less permanent changes in the individual's personality and character, especially in his ethical adjustments Whereas lack of energy and of will power and a feeling of helplessness, fear and discouragement are characteristic of almost all psychopathic individuals, these are most evident in morphinists The latter become pitiably inadequate and utterly unable to meet the ordinary demands of the business of living It is the consciousness of this mental inadequacy that causes them to seek a stabilizer and support, this they find by increasing the dose of their obtunding drug

The clinical picture of drug addiction revolves itself around a symptom-complex referable to the brain, vegetative nervous system and perverted metabolism Acute psychic disturbances develop more often as a result of abstinence than of continued use They manifest themselves most frequently as depressed, less often a manicky and rarely as paranoid states As in other toxic conditions there may be present mental confusion with a tendency to various forms of hallucinations In contrast to the alcoholic psychoses there is in

estimated, especially as we enter upon the domain of preventive medicine"

This address, delivered when our honored guest had been in practice for four years, indicates the home atmosphere, vigorous, unafraid, and forward looking, into which he was born in the year 1854, in Ontario County Receiving much of practical education within the walls of his home at the hands of his father and mother, he evidenced his early leanings toward the study of medicine He graduated from Amherst College in 1876, and studied medicine for a year in the University of Buffalo, but graduated from the College of Physicians and Surgeons in 1879

Dr John H Jewett was President of the Ontario County Medical Society in 1903, thus favoring his confreres with his guidance and counsel from the rostrum, as well as from the floor, in an humble but forceful manner Realizing the advances as they rapidly have been developed in the science of medicine, he was the first to introduce and to use the x-ray in Ontario County In this, as in all other lines he has kept abreast of the medical knowledge which it is ours to seek and to learn

For twenty-five years did Dr John H Jewett practice without the aid of hospital facilities It was by his wisdom that his patients were afforded hospital care, and now another twenty-five years has he practiced in the Thompson Hospital, of whose Executive Committee he was Chairman for a number of years

What epoch making events has our guest witnessed since the day of his graduation fifty years ago! He has seen the slow but sure evolution of Pasteur's work clarifying the theoretical reasonings of disease coming from miasma, sewer gas, and filth, and the realization of his own father's prophetic words as to preventive medicine The physician in the smaller community now has much to aid him in his individual practice—the Hospital and the Laboratory, the trained nurse and the trained family are now valued assistants to help defeat death's inevitable purpose

But as our knowledge grows the more, just by so much more does there seem to be the lengthening the end of the rain-bow of medicine which we seek to obtain without the probability of ever reaching This end was not reached in his time, it is not in sight in our time, and peering through the vista of coming years, it is yet too distant to discern

Dr Jewett, you express the realization of some of the ideals and aspirations which you acquired in the days when you listened to the words of your father forty-five years ago Your days have been full of work well done, not alone in your community and city as a physician, but in those broader fields of which your beloved father spoke so many years ago as President of the State Society We salute you on this your fifteth birthday in your County Medical Society

---

THE DIAGNOSIS OF PULMONARY TUBERCULOSIS FOR THE GENERAL PRACTITIONER*

By LAWRASON BROWN, M.D., and JOHN N HAYES, M D., SARANAC LAKE, N Y

THE diagnosis of pulmonary tuberculosis is often made to appear more difficult than it really is in the majority of cases Many papers have been written on its early diagnosis in which various minor abnormalities have been emphasized and perhaps some general practitioners have been confused by the multiplicity of signs which may lead to the discovery of the disease in its early stages It is possible that the busy doctor, with his limited time and facilities, has been led sometimes to believe that the diagnosis is often beyond his ability This is far from true In the majority of cases the family physician has the first opportunity to make the diagnosis It should be recognized that the disease when it is diagnosed is very often not in the minimal stage People have a natural tendency to postpone going to a doctor, to stick to the job as long as they are able, in the hope that minor symptoms may disappear shortly, perhaps with the next vacation J C Fowler, in fact, says that in England the working man cannot afford to be an early case of pulmonary tuberculosis, i e, his sense of responsibility to his family and to his job prevents him from consulting a doctor about symptoms which to him are more annoying than serious For this reason most of the patients referred to us and recently diagnosed have not early disease, they have signs which are easily recognized, and they would have been diagnosed earlier if they and their physicians had paid more attention to symptoms

The most important factor in diagnosing the disease is to remember that tuberculosis is very common, to have in mind the possibility of its presence To dismiss a patient having mild pains in the chest with a hasty diagnosis of neuralgia is as culpable as failing to think of appendicitis when the patient complains of pain in the ab-

* Read at the Annual Meeting of the Medical Society of the State of New York at Utica, N Y June 6 1929

A HALF CENTURY OF MEDICAL LEADERSHIP

By JAMES N VANDER VEER, M D, ALBANY, N Y

Abstract of the anniversary address by the President of the Medical Society of the State of New York at the celebration of the fiftieth year of membership of Dr John H. Jewett, A B, M D of Canandaigua N Y, in the Medical Society of the County of Ontario, on October 8, 1929

THE Medical Society of the County of Ontario has a custom of honoring their members who have completed a half century of membership, which might well be emulated by other county societies of our state

In 1904 it celebrated the Fiftieth Anniversary of the membership of Dr J R Pratt, Jefferson '51, and Dr W S Hicks, University of Buffalo, '51, and the speakers were Dr W W Keen, now 92 years old, representing Jefferson Medical College, and Dr Roswell Park, deceased, representing the University of Buffalo

In 1907 the Society held a celebration for Dr L F Wilbur, Harvard '54, and honored Dr Herbert Burrill, then Professor of Surgery at Harvard, and President of the A M A, by having him as the guest and speaker

Again in 1909 Dr M R Carson, Albany, Medical College, '57, was felicitated by Dr Albert Vander Veer, now in his 89th year, a former President of the Medical Society of this State, and father of the present speaker And now in the year 1929, you have chosen me to deliver the felicitations and good wishes to Dr John H Jewett, College of Physicians and Surgeons, Class of 1879, while his son, Dr C Harvey Jewett, occupies your presidential chair

This occasion is the more momentous because your President is the third generation of a family of physicians, for he is the grandson, and the man whom we are honoring is the son, of Dr Harvey Jewett, who practiced medicine in Canandaigua for so many years, and was a member of the Ontario County Society, and was President of the Medical Society of this State in 1883 His wisdom and foresight are shown by his address on the subject

"Some of the Perils of Life from Preventable Diseases" which he delivered on February 7, 1883, when he was President of the Medical Society of the State of New York, in which he said

"The health, happiness and prosperity of mankind must be intimately and inseparably connected with, and dependent upon, their sanitary condition Our occupation would be diminished in an essential degree if the art of preventing disease was thoroughly understood and universally practiced A difficulty arises here namely the inability of the majority of practicing physicians to properly advise their patients and patrons, in sanitary matters, owing to their own ignorance of the first principles of sanitary science We want men in every country district of the land, as well as in every city, who shall be worthy, the name of professional gentlemen, who, in general information and culture, though mingling largely or solely with the uneducated, shall be among them and not of them, and who, by reason of the power which knowledge and mental discipline gives, shall be leaders among the people in every good enterprise, and give a dignity to and a respect for the profession of medicine which, I regret, it does not fully possess today Though less in numbers because of the necessities of the case, when preventive medicine shall have attained its destined eminence, we shall hold a prouder position, and be more than ever the benefactors of the race"

It is interesting to note Dr Jewett's comments on the subject of bacteriology, which in 1883, was in the beginning of its development

"It would be impossible to discuss the perils to life from preventable diseases and protection from those perils without briefly referring to that theory of the origin and spread of contagious diseases now so widely known as the germ-theory Certain minute vegetable forms of life, known as bacteria, of various forms and possessing the power of rapid multiplication, and of being carried in the atmosphere as spores, are today claimed by many competent observers to be the active agents in the causation and spread of contagious and infectious diseases So captivating is the thought of accounting for disease in this simple way, that some observers, as well as some who are mere theorists, have, I fear, suffered their enthusiam to get the better of their cool calculating judgment Ever conflicting and positive statements, which are the fruit of carefully conducted experiments to determine the relation of this or that particular form of bacterium to this or that disease, continue to bewilder the mind of the conservative medical man, as well as to mystify the masses of scientific thinkers outside the ranks of the profession At present it becomes us to receive with caution the reported results of all such experiments, and the theories formulated therefrom, and while we accept some things as proven relative to this theory of vegetable disease-germs, to bear in mind that much which is claimed by some, may still be fairly placed in the realm of the unproven, though perhaps eminently probable The importance of determining whether these vegetable germs found in connection with certain contagious diseases are the cause or effect of the diseased condition cannot be over-

tuberculosis process, but over the upper third they are almost always due to tuberculosis Especially is this so if they have been heard on several occasions Rales can be heard in only about 50 percent of patients with pulmonary tuberculosis in the minimal stage In those without rales, slight dullness and altered breath sounds may be localized at one apex and indicate the need of a roentgenogram but the indication may be founded on the symptoms alone

The importance of the r-ray in arriving at a diagnosis of pulmonary tuberculosis cannot be over-estimated Too many patients with some suspicious elements in the history are not being given the advantage of this, in some cases the only, means of arriving at a correct diagnosis In children and in those in intimate contact with the disease this may be the case. More mistakes are made by placing too little reliance on roentgenograms than by requesting them too often The physician who relies on a laboratory will find much to stimulate his interest by taking the opportunity to look at the films of his patients He will soon learn what constitutes a good film and will learn to appreciate the difficulties of the roentgenologist A single film may help to make the diagnosis in most cases but stereoroentgenograms are usually necessary in early disease If the practitioner takes his own films he should be careful not to minimize unduly shadows at the apex, for, as with physical signs, the findings are usually above the third rib and the fifth dorsal spine They consist of irregular mottling of varying densities

Following these criteria the practitioner should not find the diagnosis of pulmonary tuberculosis difficult in the majority of cases It is important to remember that it is the common debilitating disease, and that symptoms pointing to the lungs demand that it should be sought for A history of haemoptysis of a drachm or more, or of pleurisy with effusion should make one suspect tuberculosis Tubercle bacilli in the sputum, especially if found twice, always spells tuberculosis Rales and a typical parenchymatous shadow in an r-ray plate above the third rib almost always compel a diagnosis of tuberculous disease of the lungs

domen While it is true that the mortality rate has fallen rapidly in recent years its incidence, or morbidity, rate has fallen little, if any, and it is still the common debilitating disease Of its modes of onset, the two most striking, and therefore most easily recognized, haemoptysis and pleurisy with effusion, each account for only seven per cent (Heise) Haemoptysis of a drachm or more, if mitral stenosis can be eliminated, is almost always due to pulmonary tuberculosis Less striking, and therefore more likely to be minimized, is blood-streaked sputum Bleeding of this amount is too frequently attributed to inflammation of the throat or gums It may be derived from these sources but by giving this opinion without being certain of the pulmonary condition a physician may lull, unfortunately, the suspicion of his patient When there is sputum tinged with blood, an examination of the lungs is always necessary Similarly, pleurisy with effusion occurring, as we say, idiopatically, by its usual severe onset and well-known association with tuberculosis of the lungs usually leads to a correct diagnosis, but how often a mild dry pleurisy fails to arouse suspicion of the lungs Slight pleural pains may be complained of as a heavy feeling in the chest, or a catch on deep breathing, or a dull ache and they should lead the examining physician to think of pulmonary tuberculosis

Less definite, however, than haemoptysis and pleurisy are modes of onset called insidious and catarrhal which occur in eighty percent of the patients entering Trudeau Sanatorium (Heise) In these the diagnosis is more likely to be delayed The patient is not startled into consulting a doctor early because the symptoms at first are mild and often do not point to the lungs as their source And, unfortunately sometimes, when the patient does go to his doctor the latter does not think of tuberculosis as a possible cause If one is on the lookout for the disease the taking of only a short history will often be very enlightening because most people need guidance in unravelling these minor complaints Among these may be mentioned a slight but gradual loss of weight which the patient has not been able to regain while following his usual habits, a sense of fatigue which he notices because he is more tired than usual after the day's work or because he awakens in the morning unrefreshed Often this patient goes to or is brought to, a doctor because relatives or friends have been telling him that he appears to be "run-down" and pale He may speak of his mental tiredness and if his wife wanted to she could tell of his unusual irritability Such patients are commonly given the diagnosis of "nervous breakdown" Among other early symptoms may be mentioned repeated colds, a failure to regain weight and strength after an attack of grippe, persistent slight morning expectoration or frequent clearing of the throat These symptoms are too often attributed to excessive smoking Many patients with "indigestion," flatulence and loss of appetite have pulmonary tuberculosis In fact in this disease the general symptoms rather than those definitely respiratory in origin are very frequent in the early stages and close questioning is often necessary to elicit subordinate complaints

The physician who keeps in mind the frequency of tuberculosis will more often ask for a specimen of sputum It is worth remarking that some patients who say that they have no sputum will nevertheless raise a little phlegm in the morning The State supplies containers and makes examinations free of charge and there is no excuse for failing to request a specimen from anyone who has an obscure condition and who can raise sputum, preferably in the morning The ease of making a diagnosis by this means will often surprise the doctor who has not been in the habit of making such requests It is disheartening to read that of 7478 cases of pulmonary tuberculosis reported in this state in 1926 only 45 percent had a sputum examination (N Y State D of H News, May 30, 1927) The Sanitary Code (Reg 2a Chap III) requires sputum examination in all suspected cases When sputum examinations have been done in such a low number of tuberculous cases how many less have been done in cases diagnosed as chronic bronchitis! When a patient is passing through his second attack of bronchitis during the winter this simple test is especially indicated The physician should not be satisfied with one negative report and in some cases should require special methods of examination

Another simple test which is often neglected, the use of which is very helpful in the diagnosis of this disease, is the recording of the temperature A patient who is suspected of having pulmonary tuberculosis should take and record his temperature at 8 00 A M, noon, 4 00 P M, and 8 00 P M One should not await the onset of chills and sweats The record of a week showing a daily, afternoon rise of 99 5 should throw some doubt on a tentative diagnosis of chronic bronchitis I have never seen a patient who could not quickly learn to use this simple test

Examination of the chest for abnormal signs is considered by some to be a very difficult art, but actually it is not so The confusion rests in the fact that too much emphasis has been laid on indefinite and minor changes from the normal Rales are the important sounds to search for If they cannot be heard with quiet breathing one should have the patient expire moderately, then cough, and then breathe in sharply If present, they will usually be heard by this means The location of rales is important, heard over the base of the lung they usually denote a non-

CLINICAL REPORTS

There has come to this Journal a new publication called the "Pediatric Bulletin," whose fifty-eight pages of reading matter are composed on a plan rather unique and interesting It is issued by the staff of the pediatrics department of a general hospital—the Brownsville and East New York Hospital of Brooklyn—whose cases are typical of the same severe forms of child sickness which are seen by the general practitioner

The new publication consists largely of case reports written in a brief, clear manner If a physician wishes to learn how to practice medicine, his first choice of method would be to see cases assembled in a hospital, and his second choice would be to read the reports of the cases If a doctor will read the printed reports with the same mental concentration that he applies in seeing the cases, he would get as much benefit as he does from bedside teaching

Clinical reports similar to those in the new publication will be welcomed by the NEW YORK STATE JOURNAL OF MEDICINE, for its pages are open to descriptions of the essential facts of cases which have been subjected to intensive study There is always room for such reports, and the editors will use them in every issue They are especially useful in completing a page, a quarter or half of which is left vacant in the final make-up, but in addition a page or two of such reports in every issue would appeal to the members of the Medical Society of the State of New York.

If this Journal should print reports from only one hospital in each issue, each one of the 294 New York hospitals listed in the Directory could appear only once in twelve years, but the editors will be satisfied to receive three or four reports each month from any source, either hospital or private practice or special clinics

---

PRACTICE OF MEDICINE BY COUNTY MEDICAL SOCIETIES

The scope of the practice of medicine has been broadened in the last two decades until now the family physician may not be aware of its extent unless he deliberately surveys the field in the light of Medical Progress

A generation ago the field of medicine was lighted with torches set here and there, leaving dark spaces unrevealed Almost the only bright form of torch was that of curative medicine, but it did not penetrate into great areas of mystery, such as those of diphtheria and syphilis

Medical Progress next developed torches which penetrated the regions of bacteriology and serology, and spread a glow of light over the entire field of medicine Then was developed the practice of preventive medicine, dealing with unhealthful conditions in their early stages before they became crippling

The torches of curative medicine will always gleam brightly, attracting those who are in immediate need of medical assistance, but the steady glow of preventive medicine makes little spectacular appeal, and the people generally need to have its existence pointed out to them Doctors meet its glow in whatever direction they turn, and the people assume that it belongs to them like the light of the moon But the impression is slowly dawning on both physicians and people that they must fan the glow into the flaming torch of the active practice of preventive medicine

The development of preventive medicine has run parallel with that of the electric light Fifty years ago Thomas Edison developed a flickering electric light, while Louis Pasteur lighted the uncertain torch of bacteriology Today the torch of preventive medicine will burn as steadily and reliably as that of the electric bulb But while the people are eagerly demanding the electric light, they are not besieging the offices of the doctors in order to secure the benefits of preventive medicine In fact, many still fear vaccinations and other forms of preventive medicine just as they feared electricity thirty years ago Physicians today face the same problems that Edison faced a half a century ago, and they will solve them just as Edison did, along two lines

1 They will train men in the production and application of the newer medical lights

2 They will educate the people to demand the benefits of the lights

There is now a very real threat that what happened to the manufacturers of tallow candles and kerosene lamps may happen to physicians and surgeons who fail to prepare themselves to practice preventive medicine But fortunately physicians will not need to throw away their old equipment and install new sets of expensive apparatus They need only to turn their attention to the newer forms of practice It might be wise that, like business men, they conduct free demonstrations of the practice of preventive medicine for the benefit of their own numbers Certainly demonstrations and clinics will be necessary for their advertising value in impressing the people with the desire for preventive service

But physicians will not need to create a demand for the practice of preventive medicine as Edison was forced to do in order to sell his new lamps

NEW YORK STATE JOURNAL OF MEDICINE

Published semi monthly by the Medical Society of the State of New York under the auspices of the Committee on Publication,
WILLIAM H ROSS, M D, *Chairman* Brentwood CHARLES GORDON HEYD, M D New York
DANIEL S DOUGHERTY, M D New York

Editor in Chief—ORRIN SAGE WIGHTMAN, M D New York *Executive Editor*—FRANK OVERTON, M D Patchogue

A HALF CENTURY OF SERVICE

To be a faithful member of a County Medical Society for half a century is an honorable distinction worthy of special recognition The Ontario County Medical Society has given such a recognition to Dr John H Jewett, of Canandaigua, as described on page 1413 of this Journal, and the address of Dr J N Vander Veer, President of the State Medical Society, is printed on page 1394 But there is an additional significance to the celebration, for Dr Jewett belonged to the second generation of three generations of physicians To be born with the inheritance of the fundamental qualities necessary to practice medicine is of special value to the public as well as the individual doctor

MEDICAL PROGRESS

Acute Pancreatitis — William Linder and Louis J Morse analyze 88 cases of acute pancreatitis with especial reference to diagnosis, and hold that the conception that this disease can be diagnosed only at necropsy, or on the operating table, is no longer tenable Etiologically, acute pancreatitis may result from pyemic involvment, by contiguity, by lymphogenous extension, retrogression of bile into the pancreatic duct, or regurgitation of duodenal contents into the duct of Wirsung Whether one favors one or the other hypothesis in its production, the fact must be faced that biliary disease is usually the precursor, it was demonstrated in 84 per cent of the authors' series Fat necrosis was taken as the criterion on which diagnosis was based, no case being included in which it could not be demonstrated The most frequent symptom is constant epigastric pain, this symptom was present in 86 of the 88 cases Some complained of right hypochondriac pain, others of left hypochondriac pain, and still others of generalized abdominal pain Backache was troublesome in 38 of the patients Foreign protein injected into the circulation calls forth a peculiar train of symptoms which has been designated allergic, namely, shock, collapse, cyanosis, and dyspnea Tenderness was elicited in the epigastric region in 97 per cent of the cases, in the right hypochondriac region in 67 per cent, in the left lumbar region in 66 per cent, in the left hypochondrium in 41 per cent, and there was general abdominal tenderness in 19 per cent of the cases The authors stress the importance of differentiating acute pancreatitis from other acute abdominal diseases and the value of a previous history of gall-bladder disease The early treatment of gall-bladder disease should be encouraged In acute pancreatitis immediate treatment is life-saving If the patient's condition warrants, cholecystectomy is the operation of choice and removes the source of infection, at times drainage of the gall-bladder must suffice to drain the pancreas In the authors' series the mortality rate was 26 per cent which compares favorably with that of all others —*Annals of Surgery*, September, 1929, xc, 3

The Dangerous Acute Appendix and Its Early Recognition.—D P D Wilkie points to the fact that despite the facilities for rapid transport and prompt surgical treatment deaths from appendicitis are still far too numerous This is due to delay in making the diagnosis, and it is the fatal type of case that is apt to be missed or delayed It should be recognized that there are two fundamentally different types of appendicitis (1) Acute inflammation of the wall of the appendix (acute appendicitis), and (2) acute obstruction of the lumen Sometimes both conditions are present in the same case The first type causes acute illness but is rarely fatal, the second is very dangerous and accounts for 90 per cent of the mortality from so-called appendicitis In this type of case if a concretion becomes impacted in a stenosis or kink and the appendix contains fecal matter distal to the obstruction, putrefaction, tension, and gangrene follow inevitably The characteristic history in this disease is that the patient is suddenly seized with cramping pain, usually in the umbilical or lower epigastric region There is vomiting, which may be repeated After severe pain for a few minutes to almost an hour, the pain abates If the abdomen is examined at this time, there may be just a suspicion of rigidity and tenderness in the right iliac fossa This is the vital moment If the doctor delays, successive attacks of colicky pain terminate in generalized pain and then relative comfort—the tense and gangrenous appendix has ruptured and septic peritonitis follows If the medical man is alive to the dangers of acute appendicular obstruction he gives neither purgative nor sedative, but if the pain recurs, and there is tenderness or rigidity, he will insist on immediate operation It cannot be emphasized too strongly that in cases in which the need for operation is most pressing there is frequently no rise in temperature as one of the cardinal signs The point of supreme importance is early diagnosis in the afebrile, colic-like attack which represents the early curable stage of acute appendicular obstruction —*The Practitioner*, October, 1929, cxxiii, 6

Spontaneous Meningeal Hemorrhage — O Hess reports 6 cases of spontaneous hemorrhage into the subarachnoidal space as established by lumbar puncture All the patients were relatively young and in apparent good health, with intact bloodvessels Although each case is reported in detail the author gives a general description of the condition, as follows The debut is sudden, violent, with severe pains in the head and nuchal region, nausea, and vomiting and vertigo Consciousness may or may not be affected Later the picture of meningitis is presented with paralysis of some of the

Men of vision and wealth have provided great endowments with which they have advertised preventive medicine among the people, and when the doctors have not responded with enthusiasm, the managers of the endowments have suggested that medical service be provided free at public expense, as education is supplied Hence there have arisen exasperating disputes between the impatient managers of endowments and the conservative physicians But the days of debate ended, so far as New York State is concerned, nearly two years ago when the representatives of the Medical Society of the State of New York entered into agreements with the representatives of the Health Endowments in regard to their respective fields of work (See this Journal, May 1, 1928, page 495) The physicians agreed to supply the medical service, while the lay organizations should do those educational forms of work which would be called advertising in business circles

The physicians at once organized a Committee on Public Relations which should make plans by which they could do their part in the practice of preventive medicine It was recognized that the solution would be by the action of groups of doctors in distinction from individuals The Committee asserted that the vague concept called the medical profession resided in the Medical Society of the State and County, and still more concretely, the Medical Society expresses itself through its Committee on Public Relations

The Committee on Public Relations deal with the newer fields of medicine in which physicians, while essential, are not the only workers Three of these fields in which physicians are already active are industrial medicine, anti-diphtheria immunization, and periodic health examinations When the Committee on Public Relations and the medical societies devise plans for carrying on these activities, they practice medicine in a very real form The records of this practice are increasing in bulk and importance, and how to preserve them in available form is an important problem The records will be found in the NEW YORK STATE JOURNAL OF MEDICINE to a greater extent than in any other source Some of the records are now printed in the department of News Notes, and others are put in the Scientific department, which deals with the practice of curative medicine by individuals Their importance requires a department on "Medical Society Practice," while their increasing bulk will justify the establishment of such a department in the near future

Discussions of the functions of the Public Relations Committee of a County Medical Society, such as have appeared in this JOURNAL, properly belong in the proposed department

LOOKING BACKWARD

This Journal Twenty-five Years Ago

Annual Meeting—This Journal of November 1904, consists largely of reports of the annual meeting of the New York State Medical Association, which was held in New York City on October 17-19 The address by the President, W H Thornton, emphasizes the need of a union of the two State Societies—the Association and the Society The meeting adopted the following resolution

Resolved, That the unfortunate delay in the effort of the two State medical organizations to amalgamate, due to no fault of either party, is a source of grievous disappointment to this Association

Resolved, That it is the unalterable desire of The New York State Medical Association, that harmony and good-fellowship should prevail throughout the entire profession of the State, and to that end this Association pledges itself to endeavor to secure the union of the two State organizations until that much-desired end shall have been accomplished"

The President-elect, Dr J R Goffe, said

"As far as the two societies are concerned all the articles of amalgamation have been agreed upon in the Joint Committee The consummation seemed just at hand, when upon an evil day, we fell into the hands of the lawyers The law's delay is proverbial and its precedents supreme We bow to its mandates, conform to its requirements, and wait No further legal steps, it is true, can be taken during the year in advancing the progress of consolidation, but we can educate ourselves and our fellow members to a fuller realization of what union means, its increasing power for enobling the profession, strengthening its dignity and influence, protecting it against the assaults of its enemies and advancing it to a higher plane of usefulness and unity"

ing the similarity between theoretical and actual results when the theoretical are based on the assumption that the disease is due to the simultaneous presence in the germ of five pairs of recessive factors or two dominant and four pairs of recessive factors, carried in as many chromosomes —*American Journal of the Medical Sciences,* September, 1929, clxxviii, 3

Is Ground Glass a Poison?—Dr Greiff, of the Hygienic Institute, Hamburg, speaks first of the popular belief that this substance is able to cause, when given with murderous intent, lesions of the alimentary canal which may end fatally Recently a physician was said by the daily press to have been slain in this manner, but the autopsy revealed no lesions and the final opinion was to the effect that sausage poisoning had been responsible for the fatal outcome. Various textbooks on forensic medicine indeed make ground glass a dangerous mechanical irritant when swallowed, but only a few actual cases are on record and these mostly Russian The peasantry believe that this substance has medicinal properties and it is used quite freely for certain ailments Maschka believes that serious injury occurs only when the swallowed glass contains sharp fragments of considerable size Many years ago ground glass was recommended to get rid of rats But if we study recent literature and make independent investigations it seems more and more evident that this substance is for the most part quite harmless to both animals and man Glass has been fed to rabbits, guinea pigs, dogs, cats, rats, etc , with the twofold aim of testing the glass per se and of determining whether ingestion of glass can pave the way for the absorption of bacteria From both angles the experiments resulted negatively—indeed no injury whatever could be found in the gastroenteric mucosa. The author's experiments included the benzidin test of the stools for occult blood and this also resulted negatively The conclusion is that ground glass, at least in a form which can be mixed with the food and swallowed without trouble, is quite harmless to animals and mankind —*Münchener medizinische Wochenschrift,* August 30, 1929

The Hyperthyroid Constitution—Under the term "pre-Basedow" Professor H Zondek and Dr H W Bansi describe a condition which they regard as a premonitory stage of exophthalmic goitre The subjects may present the entire picture of hyperthyroidism in a mild form, but the basal metabolism will be found normal Although easy to recognize when all the symptoms are present, the reverse is the case when but one or two are in evidence Thus with tachycardia and subfebrile rise of temperature alone diagnosis would be very difficult Von Bergmann calls these subjects "vegetative stigmatics" and states that about 70 per cent of them give a positive reaction to the Reid Hunt test, while the Volhard water test is often positive The ability of the tissues to fix water and sodium chloride stands in direct relationship with the functional state of the thyroid. The work of the heart as measured by the minute-volume is increased in the subject with "pre-Basedow" and this increase is one of the most valuable diagnostic resources, especially in differentiating from mere nervous palpitation Years and even decades may elapse before these subjects develop actual Graves's disease, and they may be regarded as ailing only when their life work is prejudiced If they complain of symptoms they should receive treatment, which should consist of a rest and recumbency cure, with the use of such sedatives as luminal in small doses The use of small doses of iodine, originally as a pre-operative measure, may be recommended, this drug favorably influencing the increased basal metabolism of actual Graves's disease and likewise benefiting the simple hyperthyroid A drop of Lugol's solution may be taken 3 times daily every second or third day, by the use of which the authors have seen the circulation favorably influenced in these subjects As for röntgen therapy and surgery, they are both out of the question in the simple hyperthyroid —*Klinische Wochenschrift,* September 10, 1929

Refrigeration of the Body as a Provocative Factor of Pneumococcus and Influenza Bacillus Infections—In an article published in the *Bulletin of the Japanese Naval Medical Association,* March, 1929, and abstracted in the *Japanese Medical World,* March 15, 1929, Dr Sadao Kudo describes experiments as to the provocation of pneumococcus and influenza-bacillus infections by exposing the body to cold Rabbits which had been immersed in ice-water received intratracheal injections of a suspension of pneumococci or influenza bacilli, following the method of Cecil and Blake It was found that congestion of the tracheal mucous membrane was caused by the sudden refrigeration of the whole body The animals undergoing only simple refrigeration succumbed to pneumonia when given an amount of pneumococci insufficient to harm a non-refrigerated animal The resistance of the animal against the pneumococcus decreased up to one-sixth that of the non-refrigerated animal The author concludes that the virulence of the pneumococcus that is already harbored in the respiratory tract or that has gained access immediately into the tract, is several times intensified by the sud-

cranial nerves and sometimes hemiplegia. Psychic symptoms, such as delirium, confusion, and somnolence may be present. The patient may die or recover and in the latter case may suffer from relapses To the observer the picture is one of an epileptic seizure, at times of the Jacksonian type The patient may fall prostrate and the post-convulsive stupor may end in death This sudden debut is not associated with meningitis in the mind of the clinician, and the condition in fact is not a true meningitis but the so-called meningism or meningeal irritation Since massive albuminuria is common, the affection may be confounded with uremia This symptom is peculiar to spontaneous meningeal hemorrhage and is not seen in other forms The clinical picture is constant but in the past has been regarded usually in the light of a symptom of nephritis Naturally our knowledge of it cannot well go back to the period before the routine use of lumbar puncture The etiology is thus far quite obscure, for its occurrence in young adults—even in childhood—would seem to remove it from the vascular diseases It has been found in association with a great variety of other affections, such as migraine, asthma, Graves's disease, etc In regard to treatment, lumbar puncture is not only the chief diagnostic resource but the chief therapeutic remedy, and often must be practised repeatedly The first puncture may save the patient's life—*Klinische Wochenschrift,* September 3, 1929

Treatment of Rickets—No less than 10 articles in the *Munchener medizinische Wochenschrift* for August 23, are devoted to the treatment and prevention of rickets H Seel writes at length on the use of irradiated ergosterol in animal experiment In rats that had been made to develop experimental rickets the remedy in question was shown to be distinctly antirachitic, even to the extent of correcting the bone deformities J Aengenendt relates the result of two years experience with the same substance in the prophylaxis of rickets in mothers and children While in the majority of cases the results were positive, many failed to benefit and these refractory cases require further study G Künl writes on the use of dilute irradiated ergosterol as a result of the claim that overdoses are harmful His material of 14 cases is, as he admits, too small for the drawing of final conclusions He uses the solar ray results as a criterion and believes that small doses over a relatively short period give good results—4 to 6 weeks should be sufficient M Rodecurt saw several cases of alteration of the skin, chiefly pigmentation, follow the use of the remedy in question, the patients being nurslings The discoloration disappeared on suspending the treatment. Zoelch, of Professor von Pfaundler's pediatric clinic, Munich, discusses especially the quartz lamp prophylaxis and concludes that it requires too much time and cannot be carried out on a large scale H Hentschel and A Roszkowski, of the same clinic, give their experience with irradiated fresh milk They decide, however, that the method is not practical A Wiskott, also of the Pfaundler clinic, writes on irradiated ergosterol as a prophylactic and concludes that it is a worthy accessory to other measures, while O Ullrich devotes a long article to negative results, both in human and animal rickets, which lead him to believe that thus far we have not reached the heart of the subject. Finally Pfaundler himself expresses his belief that treatment is far in advance of prophylaxis

The Inheritance of Mongolian Idiocy—From a survey of the literature dealing with Mongolian idiocy, Madge Thurlow Macklin concludes that there is no adequate support for the contentions that syphilis, mental, or physical suffering of the mother during pregnancy, advanced age of the mother at the time of conception, reproductive exhaustion due to a large number of pregnancies, or a great discrepancy in the ages of the parents have any etiological significance in the production of this disease. These and various environmental influences that may be mentioned are not the cause of Mongolian idiocy The fact which forces one to abandon these arguments is that there are accumulating more and more instances in which at the time the Mongol is born, there is born also a normal twin If environmental influence is to have any effect upon the developing fetus, then both twins should be affected Mitchel and Downing found that in 24 instances in which mongolism had been reported in twins before 1926, there were only 3 cases in which both twins were affected They were of the same sex There is much in favor of the defect being inherent in the germ cell, that is, inherited There comes in the conception of uniovular and biovular twins If from two ova it is not necessary that they be alike, either in sex or characteristics, but if they are derived from one ovum they must be identical with respect to both these features The author tabulates 47 cases of mongolism in twins and only one of these controverts her theory, in this case the twins were said to be uniovular, one being a Mongol and the other normal There is no support for the statement that Mongolian idiocy is due to the presence of one pair of unit recessive factors Its mode of inheritance seems to be much more complex Figures are given show-

MOTOR VEHICLES — LIABILITY OF OWNER OF CAR USED WITH HIS PERMISSION

'May I use your car, mine is laid up and I have an important business engagement to fulfill some distance from here tomorrow morning?" or "Dad, can I have the car tonight? There is a dance at the country club"

Most of us do not like to refuse what seems to be a reasonable request, especially when it is voiced by one of our friends or those nearest and dearest to us However, one should not carelessly loan his car to another without first considering the possible legal liability thus imposed upon him in the event that an accident should occur through the negligence of the person to whom the car is loaned

For many years in this state, it was the law that the owner of an automobile was not liable for the negligence of one operating his motor car unless, to adopt the language of the courts, "by a servant in the business of a master" With the increased popularity of the motor car and the constant increase in the number of motor vehicle accidents as a result thereof, the courts though reluctant, were compelled by reason of the law, to deny compensation to many victims, because the person who caused their injury was financially irresponsible and the owner of the motor car was exempt since the person causing the injury was not at the time of the accident engaged in the business of the owner It frequently happened that the father of a family would loan his automobile to his wife, son or daughter to be used for their own pleasure If an accident occurred through their negligence, the father could not be held because of the rule of law above set forth, and the particular member of the family who happened to be operating the car was, in most instances, financially irresponsible To meet this situation a statute was passed, which is now Section 59 of the Vehicle and Traffic Law It provides, so far as material

'Every owner of a motor vehicle or motor cycle operated upon a public highway shall be liable and responsible for death or injuries to person or property resulting from negligence in the operation of such motor vehicle or motor cycle, in the business of such owner or otherwise, by any person legally using or operating the same with the permission, express or implied, of such owner"

The effect of this statute is well stated by our Court of Appeals in the following language

"Liability is no longer dependent upon use or operation by a servant in the 'business' of a master Liability is dependent upon legal use or operation in business 'or otherwise,' with permission or consent The owner who loans a car to a friend or an employee will be liable hereafter for the negligence of the operator though the loan is unrelated to employment, a mere friendly accommodation The father will be liable for the negligence of the son to whom he has intrusted the use of the family automobile * * *"

An interesting question arose under this section with respect to whether or not the statute applies with equal force to an injury received by a guest of the person to whom the owner has loaned his car, where such guest was travelling with the owner's permission, express or implied In holding that the section did so apply, the Court of Appeals said

'Doubtless the Legislature, in enacting the section, chiefly had in mind, as a mischief to be cured, the remediless plight of a highway traveler injured by a motor vehicle, other than the one in which he might be traveling, through the recklessness of an irresponsible driver to whom the owner had intrusted the vehicle and thereby made the accident possible We cannot say that the Legislature did not equally have in mind the case of a guest traveling, with the consent of the owner, in the very automobile by the reckless driving of which injury was inflicted upon him Certainly the section itself draws no distinction between the guest and persons otherwise using the highway, denying to the former, and according to the latter, a remedy against the owner It ordains merely that the owner of the vehicle shall be liable and responsible 'for death or injuries to person or property' The class of persons for whose death, or for whose personal or property injuries, there shall be owner's liability is in nowise restricted by the terms of the section We see no sound basis upon which we may interpolate restrictive words into the section Therefore, we think that the provisions of section 282-e applied to give these plaintiffs a remedy against

den refrigeration of the body, and that the pneumococcus which gained immediate access into a body deranged by the sudden exposure to cold was very harmful and dangerous. The experiments indicated that the Pfeiffer bacillus is indifferent to the refrigeration of the body, but it is possible that this organism except in symbiosis with some other, is not pathogenic

Changing Views on Pulmonary Tuberculosis.—Otto Wild alludes to the now discredited view that this malady has three stages of which the first is a massive infiltration of one pulmonary apex. One of those who have done the most convincing work in this direction is K. E Ranke, although naturally his teachings have been attacked in turn. The first local lesion, which usually develops where the bacillus nests, is very small—at the largest no bigger than a hazel nut. It is relatively unirritating and seen under the microscope is a miniature focus of pneumonia. But lymphatic infection is sure to result, beginning at the nearest nodes with later participation of the more remote links of the chain. These changes in the lymphnodes may set up separate symptoms Blood metastases may also develop in time. When diffusion occurs along the lymphatics and blood vessels we have the second stage of the disease which is now at its acme, in full bloom. Any complication may develop—meningitis, joint disease, renal lesions, etc. With the penetration of the bacillus into the organism at large an allergy develops and the patient becomes sensitized. This allergy is in no sense incompatible with the acquired immunity of which so much is now written, for the two occur side by side and each may be measured. At the end of the series stands the massive pulmonary focus, which has usually been regarded as an early and not a late development. It forms an isolated manifestation of the disease. Before the work of Ranke we knew almost nothing of the first phase save in tuberculosis of the nursling. Mostly it is silent but we may encounter the usually expected fever, wasting, and anemia. In benign cases the focus becomes calcified. Diagnosis in the early phase can be made in the silent case through the tuberculin reaction and röntgenography. It is in this phase of the disease that more or less extensive infiltration of the bronchial lymphnodes may develop When, as so often happens, a massive apical infiltration occurs, Ranke is inclined to the opinion that this is due to a superinfection from without, the sensitized parenchyma of the lung falling an easy prey to the bacillus—*Schweizerische medizinische Wochenschrift*, August 31, 1929.

The Causes and Treatment of Persistent Nasal Catarrh, Particularly in Children.—Daniel McKenzie, writing in the *British Medical Journal*, September 7, 1929, II, 3583, states that nasal catarrh differs from "a cold in the head" in being chronic From the clinical standpoint the cases may be divided into two groups—those in which the catarrh can be traced to a local cause or focus, and those in which no such local cause can be found. The chief local causes in children are adenoids and nasal sinus suppuration. When nasal catarrh persists after adenoids, and perhaps also tonsils, have been removed, there are two further possible causes, which may be combined, namely, enlarged posterior ends of the inferior turbinals, and nasal sinus suppuration. With regard to the former, they should be examined at the time of the tonsil or adenoid operation, and if they are much enlarged they should be removed, if only slightly swollen they may be left as they will probably subside with improvement in the local condition. Having excluded adenoids and the posterior ends of the turbinals as a cause of nasal catarrh, the ethmoidal region and the maxillary antra should be examined, remembering that neither transillumination nor *x*-ray examination is of much value in childhood For the antra, proof puncture under general anesthesia is alone reliable. If simple lavage fails to cure the antrum suppuration, a nasal antrostomy opening may be made. Operation through the canine fossa is not recommended prior to the eruption of the permanent teeth. Another abnormality causing nasal catarrh is deviation of the nasal septum, a source of trouble much less common in children than in adults Operation incurs the risk of stunting the growth of the nose, and it should be undertaken only when the nasal obstruction and catarrh are interfering with the child's normal development, otherwise it should be postponed until after puberty McKenzie states that we no longer contemptuously reject the belief that exposure to cold, particularly in the case of sedentary, indoor people, will predispose to and often actually precipitate an attack. He is opposed to the hardening process applied to children, as, for example, exposure of the legs which he says is neither safe, sensible, nor decent. He would also guard against the opposite extreme of so much clothing that the child lives in a continual bath of perspiration In persons susceptible to recurrent colds, all possible sources of sepsis and irritation should be removed and a high resistance should be built up and maintained against the coryza-producing virus by hygienic measures, both personal and communal. Vaccines are sometimes helpful

LEGAL

By Lloyd Paul Stryker, Esq
Counsel, Medical Society of the State of New York

MOTOR VEHICLES — LIABILITY OF OWNER OF CAR USED WITH HIS PERMISSION

'May I use your car, mine is laid up and I have an important business engagement to fulfill some distance from here tomorrow morning?" or "Dad, can I have the car tonight? There is a dance at the country club"

Most of us do not like to refuse what seems to be a reasonable request, especially when it is voiced by one of our friends or those nearest and dearest to us However, one should not carelessly loan his car to another without first considering the possible legal liability thus imposed upon him in the event that an accident should occur through the negligence of the person to whom the car is loaned

For many years in this state, it was the law that the owner of an automobile was not liable for the negligence of one operating his motor car unless, to adopt the language of the courts, "by a servant in the business of a master" With the increased popularity of the motor car and the constant increase in the number of motor vehicle accidents as a result thereof, the courts though reluctant, were compelled by reason of the law, to deny compensation to many victims, because the person who caused their injury was financially irresponsible and the owner of the motor car was exempt since the person causing the injury was not at the time of the accident engaged in the business of the owner It frequently happened that the father of a family would loan his automobile to his wife, son or daughter to be used for their own pleasure If an accident occurred through their negligence, the father could not be held because of the rule of law above set forth, and the particular member of the family who happened to be operating the car was, in most instances, financially irresponsible To meet this situation a statute was passed, which is now Section 59 of the Vehicle and Traffic Law It provides, so far as material

'Every owner of a motor vehicle or motor cycle operated upon a public highway shall be liable and responsible for death or injuries to person or property resulting from negligence in the operation of such motor vehicle or motor cycle, in the business of such owner or otherwise, by any person legally using or operating the same with the permission, express or implied, of such owner"

The effect of this statute is well stated by our Court of Appeals in the following language

"Liability is no longer dependent upon use or operation by a servant in the 'business' of a master Liability is dependent upon legal use or operation in business 'or otherwise,' with permission or consent. The owner who loans a car to a friend or an employee will be liable hereafter for the negligence of the operator though the loan is unrelated to employment, a mere friendly accommodation The father will be liable for the negligence of the son to whom he has intrusted the use of the family automobile * * *"

An interesting question arose under this section with respect to whether or not the statute applies with equal force to an injury received by a guest of the person to whom the owner has loaned his car, where such guest was travelling with the owner's permission, express or implied In holding that the section did so apply, the Court of Appeals said

"Doubtless the Legislature, in enacting the section, chiefly had in mind, as a mischief to be cured, the remediless plight of a highway traveler injured by a motor vehicle, other than the one in which he might be traveling, through the recklessness of an irresponsible driver to whom the owner had intrusted the vehicle and thereby made the accident possible We cannot say that the Legislature did not equally have in mind the case of a guest traveling, with the consent of the owner, in the very automobile by the reckless driving of which injury was inflicted upon him Certainly the section itself draws no distinction between the guest and persons otherwise using the highway, denying to the former, and according to the latter, a remedy against the owner It ordains merely that the owner of the vehicle shall be liable and responsible 'for death or injuries to person or property' The class of persons for whose death, or for whose personal or property injuries, there shall be owner s liability is in nowise restricted by the terms of the section We see no sound basis upon which we may interpolate restrictive words into the section Therefore, we think that the provisions of section 282-e applied to give these plaintiffs a remedy against

this defendant, if the car was negligently driven by the defendant's daughter upon an errand assented to by the defendant"

It will be seen from what has already been written, that the law places a heavy penalty upon the owner of a motor car who loans his car to a reckless or careless driver Before we permit another to use our car, we should be reasonably sure that that person is a competent and careful driver

OBSTETRICS — CLAIMED NEGLIGENCE CAUSING FRACTURE OF CLAVICLE OF BABY

In this case an action was brought by a father individually and also as guardian ad litem of his infant daughter, to recover damages against the doctor for alleged malpractice

The complaint charged that the defendant had been engaged to deliver the mother of the child, and that he did deliver her of a baby girl, but did it in such a negligent and unskillful fashion as to cause the baby's clavicle to become fractured

From the facts it appears that the mother and father came to the doctor's office, and the man requested the doctor to deliver his wife The doctor told him what his fee would be, but the man stated that he could not afford it, that they were poor people and prevailed upon the doctor's good nature to reduce the fee to a more nominal sum The child, a baby girl, was delivered by the defendant at the hospital The delivery was uneventful and the child was sound and normal in every respect The mother and child remained in the hospital for about two weeks and were discharged in perfect condition The doctor had seen the mother and child every day during the time that they were in the hospital and no complaint was ever made about any condition relating to either the mother or the baby About a week after they left the hospital, the mother called the doctor to her home, stating that the baby was not well The doctor made an examination of the baby and found that she had a fracture of the right clavicle Although the doctor knew from his examination of the child in the hospital that the child was in perfect condition when it left there, the mother denied that any accident happened to the child since its return from the hospital The doctor continued to treat the baby's shoulder for about three weeks, when one day the father called at the doctor's office and stated that he was too poor to pay any money The doctor then said that he would be willing to treat the child at his office for no fee, but the father said it was too far to bring the child He requested the doctor to give him a note to the dispensary, with which request the doctor complied He never saw the parents again and was thereafter served with a summons and complaint

It was an obvious attempt to extract money from the defendant, and when the plaintiff saw that no settlement could be procured he took no further steps in the action, and on our motion the action was dismissed for lack of prosecution

CLAIMED NEGLIGENCE IN INTRAVENOUS INJECTION

In this case, a woman was referred to the defendant by a physician who had examined her, but was not able to make a definite diagnosis of the illness from which she was suffering, although he ventured the opinion that it was some sort of stomach trouble

The patient came to the doctor and gave a history which indicated the necessity for x-ray pictures of her gall-bladder The doctor placed the woman in a chair and after rubbing her arm with alcohol, sterilized his needle and proceeded to give her an injection intravenously with a preparation designed to render the gall-bladder in such condition that an x-ray picture would disclose its condition He cautioned the woman not to move while the injection was being given When he had injected about 25 c c the patient moved her arm and the doctor immediately noticed that her skin at the point where the needle was inserted was rising, so he pulled the needle out Then he took hold of the skin and pressed out some of the fluid and then applied iodine and alcohol as a disinfectant The patient remained in his office in order to have the x-ray picture taken. The doctor dressed the arm She returned the following day and the doctor put cold compresses on the arm The next day she again returned and the doctor took another picture of her gall-bladder At this time the doctor

says her arm was improving He never saw or heard from her again until he was served with a complaint, charging that he failed to use care and skill in treating the plaintiff, in that he injected a certain liquid into the tissues of the plaintiff's arm instead of injecting a liquid into the plaintiff's vein, causing the plaintiff's arm to become infected and further causing an ulcer, which left a permanent scar on her right arm

The case came on for trial The plaintiff testified that she had not been warned by the doctor with respect to moving and further stated that she did not move The doctor, however, testified that he had warned the patient about the dangers of moving during the injection, and further that she had suddenly jerked her arm during the injection In both of these statements he was corroborated by his nurse who was at the time of the trial not in his employ and not friendly to him The issues raised by the pleadings were submitted by the trial court to the jury, which promptly returned a verdict in favor of the doctor

---

DIATHERMY — CONTRIBUTORY NEGLIGENCE CAUSING BURN

In this case the complaint charged that the plaintiff employed the doctor to cure him of a rheumatic malady, but the doctor did not use due care and skill in that he unskillfully applied electrical treatment to the plaintiff's back, too much heat was applied and the defendant failed to use the proper appliances to protect the plaintiff from getting burned, with the result that the plaintiff became severely burned Damages were asked for in the sum of $5,000

It appeared that the plaintiff, a man forty years of age, came to the doctor's office complaining of pain in the sacro-iliac region and giving a history of having been bothered by that condition for some time The doctor advised diathermy and baking treatment, which he administered to the plaintiff The treatment was applied for twenty minutes Before administering the treatment the doctor gave careful instructions to the plaintiff that he should not move during the treatment and explained to him the possibilities consequent for his failure to obey the doctor's instructions The patient returned two days later for similar treatment, and after the treatment had been administered for fifteen minutes the doctor noticed that the patient suddenly jerked his body and immediately complained of a burning feeling The doctor shut off the current and removed the pads, and the patient left He returned four days later and the doctor found that he had a redness where the pad had been applied on the previous occasions The doctor gave him boric acid and zinc oxide solution and the patient went home, but he never returned

The case came on for trial and the issues were submitted to the jury who returned a verdict in favor of the doctor

LONDON LETTER

London, November 1, 1929

Milk Supplies

When I was in Toronto in December last, I was told that owing to the methods adopted in that city for the control of the milk supply, mesenteric tuberculosis in children, which is essentially bovine in origin, had been practically stamped out That this ideal is far from being reached in England is seen from the discussion in the Section of Public Health at the Annual Meeting of the British Medical Association in Manchester last July Dr Savage, County Medical Officer of Health of Somerset, reviewing the difficulties that confront the authorities whose duty it is to assure a clean milk supply, deplored the slow growth of the Milk Grading Scheme There are two grades recognized by the Ministry of Health which may be considered tubercle free within narrow limits (1) "certified" milk obtained from dairy herds each cow of which has passed the tuberculin test and is inspected by a veterinary surgeon every six months Milk is bottled on the farm (2) "Grade A" (tuberculin tested) milk, obtained from cows tested in a similar way as for "certified" milk, but the bottling is done before distribution After this scheme had been in operation for eight years (December, 1927) only 4300 cows were "certified" and 5950 "Grade A" tuberculin tested Estimateing 500 gallons per cow this means that only a little more than 5,000,000 gallons of milk per year conform to these tests When we consider that in England 280,000,000 gallons of milk are transported annually by railway alone, we can realize how small a proportion of the milk consumed is derived from tubercle free herds Dr Savage estimates that 40 per cent of all cows in this country give a positive reaction to tuberculin compared with 3 3 per cent in the United States, and though, of course, all reactors are not "open" cases, that is, liable to shed tubercle bacilli into their surroundings, he still estimates that the "open" cases amount to 1 per cent It is obviously impracticable to destroy all cows which react to the tuberculin tests when the proportion is as high as 40 per cent and the tracing of "open" cows by testing the milk from individual farms is a slow business, especially if inoculation tests have to be done, and it is very expensive In spite of all these difficulties, however, there is some consolation in the knowledge that deaths due to bovine tuberculosis have decreased in a very marked degree, the non-respiratory tuberculosis death rate having been reduced by 48 3 per cent since 1912, but it is still estimated that 2,000 deaths occur in England every year from tuberculosis due to bovine tubercle bacilli in addition to an unknown amount of invalidism It looks as if we must rely for some time at least on pasteurization and though no method of pasteurization on a large scale has yet been agreed upon, some of the chief firms of milk distributors have installed pasteurization plants run on scientific lines and controlled by frequent bacteriological examinations, and these are model institutions I had the opporutnity a few months ago of inspecting a depot where 48,000 gallons of milk were dealt with daily, and I am satisfied that everything was done to attain the highest degree of cleanliness

Drunkenness

London has been mildly amused by an article cabled from New York which had appeared in the current supplement issued by the Methodist Board of Temperance This article was contributed by an American Scout Leader who had been on a visit to England to attend the recent Jamboree, and contained a blood curdling account of "hideous scenes of drunkenness" which he had been so unfortunate as to witness "in a fashionable part of Westminster" Alas! my London! Can it be that the penetrating eye of a passing Boy Scout has discovered a plague spot which had been successfully hidden from us all? How great then is our indebtedness to Lord Baden Powell that this pupil of his should have turned the practice of shrewd observation to such purpose Or is it possible that the sister art, that of the story 'round the camp fire, has been developed in this young Scout Leader to a pitch that must excite in us the most unbound admiration? I put aside the report recently issued telling us of the rapid and persistent decrease in the number of charges of drunkenness in the police courts, and visualize the return of those nights which seem so far away, when the night porter puts his head in the common room and summons the House Surgeon to attend to one more "drunk with a cut head, sir"—ah! those days of long ago—are we to see them once again?

H W CARSON, F R C P

NEWS NOTES

COMMITTEE ON PERIODIC HEALTH EXAMINATIONS AND ITS POLICY AND PROGRAM

I This Committee is delegated "to study and popularize Periodic Health Examinations and to conduct a Health Week in connection therewith"

II The short name of this Committee shall be the Committee on Periodic Health Examinations

III The work before the Committee is of great and continuous importance to the public and to the medical profession It cannot be completed in the one year of the Committee's tenure, but this one year can be a year both of accomplishment and preparation The most satisfactory result of its labors may be the laying of a foundation for permanent, unhurried, and solid progress We shall, therefore, plan the work of the year as the first of a continued campaign to be carried forward by these members of the Society who may be delegated to the task

IV The work of the Committee shall be
A To produce immediate results,
B To develop a policy and a program,
C To complete satisfactorily the first year of this program

V The first work of the Committee must necessarily be clearly to determine its province, purpose, and function The following is submitted, therefore, as a point of departure 'The Health Examination will save life It will decrease suffering, postpone deterioration and decay It will increase health, happiness, and efficiency" We believe that it is the duty of the medical profession not only to give this message to the people of the State, all of them, but to give it with power, conviction, and result

VI We must make sure first that we know what a Health Examination is and what it is not We must have evidence, i e, "facts" not 'opinions," "experience," not "authority," that the Health Examination will do as we state —that it will save life, lengthen life, decrease suffering, and postpone deterioration and decay, increase health, happiness, and efficiency These facts must be facts pertinent from every branch of medicine, abundant, conclusive, and vigorously convincing Moreover we must prepare and give to the physicians of the State a clear and feasible method of personal professional procedure for their individual adjustment to this expanding opportunity

VII Do we know what a Health Examination is? Is there a general agreement? The following may serve "A Health Examination is an inspection of a man (presumably in health) to determine ways to lengthen life, detect disease and deterioration, increase health, happiness, and efficiency by every possible way to a skilled and understanding medical advisor"

VIII The varieties of the Health Examination

A careful study of the situation shows an astonishing diversity of procedures which are called Health Examinations and a number of kinds of Health Examinations which have been going on under different names These vary as to (a) Purpose, (b) Time, (c) Place, (d) The kind of client, (e) The kind of examiner

These topics have been discussed in outline in the September 15th, 1929, issue of the NEW YORK STATE MEDICAL JOURNAL They should be taken into consideration in discussion of the proposal or adoption of Health Examination forms It may be advisable to have several forms to meet several different conditions This will require careful consideration

Immediate progress for September and October

I Decide main lines of policy and program on meeting September 20th

II Provide for brief address to be given at the different meetings throughout the State

III Publish the report of the September 20th meeting in the State Journal elaborating on policy and program and putting all members of the State Society on the alert.

IV Write to the County Medical Societies stating policy and program, asking for comment and suggestions, asking further specifications for reports on what they have done, are doing or contemplate doing, setting forth the necessity of obtaining from their members preclinical data for our fact-gathering campaign, acquaint them with our proposed schedule of popular campaigns, asking for the designation of one or more members with whom we will communicate

V Urge members of the Committee to prepare articles on preclinical signs and preclinical medicine

VI Invite the various State Societies to join our program, asking support and offering cooperation for their own programs, if any

VII Inform all organizations represented in health, education, social and business affairs throughout the State of our intention and our desire for their cooperative efforts, and proceed to develop cooperation

VIII Campaigns

1 A campaign for the development of the physicians' interest and information will be continued throughout the year

2 A campaign for children will be conducted on or about May Day, to correlate with the National Campaign already in operation

3 A campaign for pre-school children will cooperate with the Summer round-up

4 It will enter into no controversy

November

IX Policy

1 The Committee insists on knowing thoroughly what it is about and where it is going and how its work will affect the medical profession and the public before it begins its campaign

2 It proposes to erect permanent landmarks and build lighthouses rather than to set off occasional fireworks

3 It will avail itself to the utmost of the knowledge on Health Examinations wherever it may be found

4 It will enter into no controversy

5 It will do nothing that it finds others can do as well and will seek to avoid the possibility of the duplication of effort

6 It will aid county and city campaigns, but not conduct them

7 It will seek to interest business and other organizations for social, fraternal, and philanthropic purposes throughout the State to the extent that the committee can make use of their machinery for reaching the population of the State through many channels and in many ways

8 It will seek to lead, direct, build, and inspire

9 The objective is "For every citizen of the State a health examination"

PUBLIC RELATIONS COMMITTEE

The regular monthly meeting of the Public Relations Committee of the State Society, held in Albany on October twenty-first, considered several questions of vital interest to the medical profession

The question referred to the Committee by the Council regarding the difficulty of the collection of medical fees in Workmen's Compensation cases was found not to exist in a majority of hospitals in New York State Seventy-one per cent of the hospitals of the state replied to a questionnaire Out of one hundred seventy-four hospitals, only twenty do not admit compensation cases to their wards, but these twenty admit them as private or semi-private patients

Fourteen hospitals prohibit physicians from making charges for services rendered compensation cases on the wards, and seven of these are in New York City municipal hospitals Three out of the fourteen that do not permit physicians to make charges are private hospitals and have their physicians on salary, and four other hospitals have regulations preventing physicians receiving compensation for ward cases Therefore, one hundred sixty of the hospitals in New York State replying to the questionnaire permit physicians to collect fees for compensation cases It, therefore, appears that the problem supposed to exist does not actually exist except in a very small number of hospitals

The work of the Public Relations Committee in meeting with the County Societies' Public Relations Committees shows a definitely growing interest in the need for cooperative relationship with other health agencies This is an interesting medical position, and in the judgment of the Committee it is a splendid evidence of sure advancement in giving to the public an approach to continuous medical service, while people are well

The relationship of the medical profession to the county general hospitals as to members on the staff is having definite study and will be one of the major pieces of work of the Committee during the next two months

The Committee is planning to issue reprints of its reports which have been published in the Journal, for the purpose of keeping the members of the Society interested in the development of cooperative relationship with other agencies on a basis of good will

The meeting adjourned to meet again in Albany in November W H Ross, *Secretary*

THE FIRST DISTRICT BRANCH

The First District Branch of the Medical Society of the State of New York held its twenty-third annual meeting on Friday, October 25, 1929, in Briarcliff Lodge, Briarcliff Manor, N Y

The meeting opened with a luncheon at one o'clock, which was attended by fifty members This was followed by addresses by some of the officers of the State Society Dr James N Vander Veer, President, described some of the major activities which are now being carried on by the

State Society and its constituent county societies Dr John A. Card, chairman of the special committee on Group Insurance against Malpractice, described the form of insurance which has been adopted by the State Society and urged all the doctors to take that form because it was the most economical and safest form of insurance

The question of periodic health examinations was presented by Dr C Ward Crampton, chairman of the special committee on Periodic Health Examinations of the State Society Dr Crampton closed with a plea that all the doctors interest themselves in this form of medical activity and practice.

The scientific speaker of the afternoon was Dr Thomas B Futcher of the Johns Hopkins Hospital, Baltimore, Md, who spoke on "Etiology of Diabetes Insipidus"

RADIO TALK ON HAIR REMOVERS

The Medical Information Bureau of the Medical Society of the County of New York and the New York Academy of Medicine is managing radio talks on health subjects The following is an abstract of a talk given by Dr Howard Fox on September 30th through Station WEAF on the subject of hair removers—EDITOR'S NOTE.

I should like to warn you against the dangerous method of removing superfluous hair which is widely advertised in many of the daily newspapers and lay journals These advertising establishments use *x*-rays for treating superfluous hair That *x*-rays are used is proved by the appearance of the skin in those who have been injured The *x*-rays when properly used by experienced persons constitute a safe and extremely efficient agent for treating many diseases of the skin and scalp It is also true that it is possible to remove superfluous hair by the *x*-rays There is, however, too great danger of injuring the skin by this agent to warrant its use

Advertisers quote statements from standard text books on skin diseases to the effect that *x*-rays cause permanent fall of hair This is perfectly true, but they neglect to say that these very same authors condemn the use of *x*-rays for superfluous hair on account of the danger of serious injury to the skin

The bad results which may follow such treatment consist of prominent blood vessels and freckles which are often extremely disfiguring and almost impossible to remove In the more severe cases of injury, whitish spots, warty growths and even cancer may eventually occur Physicians are now seeing an increasing number of these unfortunate cases in which the disfigurement is often infinitely worse than the original hairy growth The sad part is that these injuries are permanent, whereas superfluous hair can always be removed by one method or another While women constitute the majority of the victims, men occasionally patronize these quacks and take their chances of injury I have recently seen a man who underwent this treatment for an extensive hairy growth of the body As a result, the greater part of his back, chest and abdomen was severely and permanently burned.

Many of these advertising concerns employ a physician who is regularly licensed to practice medicine, but none of these doctors have any standing with their medical brethren They are physicians who have gone wrong and are turned quacks

Many unfortunate women could have been saved from injury due to these quack methods if they had consulted their family physician at the outset. The average woman, however, feels ashamed to discuss the subject of superfluous hair with her physician or even with her husband Many women have told me that they had been treated by these illegal practitioners without consulting any other member of their family As a protection against this as well as numerous other forms of medical quackery, I cannot urge too strongly that everyone should have a medical adviser in whom he or she has implicit confidence. The general practitioner is the logical one for this purpose. Any physician, however, whether family doctor or specialist, can act in this important capacity

In conclusion, I would like to warn you against corporations who practice medicine and advertise in the newspapers They are after your money If you want information about things medical, don't trust to your own judgment, but consult your family doctor

ONTARIO COUNTY

A meeting of the Ontario County Medical Society was held on Tuesday, October 8, 1929, at Wenna Kenna, East Lake Shore The following officers were elected

President, Dr Charles W Webb, Clifton Springs

Vice-President Dr Barton I McDowell, Bristol Center

Secretary Dr D A Eiseline, Shortsville

Treasurer Dr Hubert Schoonmaker, Clifton Springs

Censors Dr W T Maloney, Geneva, and Dr F C McClellan, Canandaigua

Delegate to the State Society Dr C C Lytle, Geneva, Alternate, Dr C W Selover, Canandaigua

Dr James D Tyner, of Canandaigua, was elected to membership

The Society voted to continue the Medical Bulletin which was published last year

The special occasion of the meeting was a tribute to Dr John H Jewett of Canandaigua, on attaining fifty years of membership in the County Society A banquet was held in his honor, and he was presented with a book on *x*-rays on behalf of the County Society, by Dr A M Mead of Victor, one of the older practitioners of the County

The address of the evening was given by Dr James N Vander Veer, President of the Medical Society of the State of New York, which is printed on page 1394 of this issue of the JOURNAL

The testimonial was of special significance because the father of Dr John H Jewett, Dr Harvey Jewett, had practiced medicine in Canandaigua for many years and had been President of the Medical Society of the State of New York Furthermore the son of Dr John H Jewett, Dr C Harvey Jewett, is now president of Ontario County Medical Society and presided at the dinner in his father's honor

Dr Harvey Jewett, the first of three generations of Jewetts to practice medicine in Ontario County, was born on November 19, 1809 in Allens Hill, in the western part of Ontario County He lived with his older brother, Dr Lester Jewett, who resided in the town of Seneca, Ontario County, and was a member of the County Society as far back as 1823 Dr Harvey Jewett graduated from Fairfield Medical School in 1832, and practiced in Allens Hill until 1852 when he moved to Canandaigua He died September 5, 1888, and was in the active practice of his profession until the day before his death

D A EISELINE, *Secretary*

SCHOHARIE COUNTY

The seventy-second annual meeting of the Schoharie County Medical Society was held in the High School Library, Cobleskill, N Y, at 4 P M, Tuesday, October 15, 1929

After the meeting had been called to order by the President, C L Olendorf, the minutes of the last semi-annual meeting read and approved, the following officers of the Society were elected and committees appointed for 1930

OFFICERS

President Edward S Simpkins, Middleburgh
Vice-President Joseph F Duell, Jefferson
Secretary Herbert L Odell, Sharon Springs
Treasurer Le Roy Becker, Cobleskill
Censor Willard T Rivenburgh, Middleburgh
Delegate to State Society with power of substitution John J Beard, Cobleskill

COMMITTEES

Legislative—H R Bentley, L R Becker, C L Olendorf, H J Wright

Public Health—H L Odell, W S Pomeroy, L Driesbach

Publicity—J J Beard, L Driesbach, R G S Dougall

Public Relations—L R Becker, W S Pomeroy, D W Beard

H R Bentley as delegate to the meeting of the State Society at Utica, gave a brief but an excellent summary of it

A communication from C Ward Crampton relative to Periodic Health Examination was read and thoroughly discussed—Dr Champlin, D S H O of Oneonta stated that while the members of our profession have long recognized its worth and importance in conserving the life and health of the people, but few persons have as yet been sufficiently impressed to appreciate their own great need of a thorough physical examination each year, and to know that this can and should be done by their family physician, and that as much time and care is required to complete the examination, the compensation therefor should be adequate

The necessity of immunizing children, especially those of pre-school age against Diphtheria is now so well and favorably known that the members of our Society feel that in their education of the people in the need of this one preventive measure so much has been done gratuitously that in the future the ordinary office fee at least should be paid therefor, either by the parent, guardian or better by the public as the life of even one individual is too great an asset to the community to be weighed against the cost of immunizing every child therein

J J Beard gave a very interesting account of his visit to the meeting of the American Medical Association at Portland, Oregon

After a suggestion made by D W Beard that the Society have prepared health articles for publication in each of our county papers several times during the year, for the proper information of the public relative to health problems, it was duly moved, seconded and carried that our Publicity Committee and our Public Relations Committee act in conjunction in having this program carried out

The members of the Society and the visitors enjoyed a very delicious dinner at Hotel Augustan after which, on returning to the High School

Library, we were most helpfully entertained by Dr John M Swan, of Rochester, New York State Chairman of the American Society for the Control of Cancer Much emphasis was placed on the necessity of early recognition especially of precancerous lesions and conditions

At 7 30 P M Doctor Swan gave in the High School Auditorium a public address on "Cancer" to a large and interested number of people, making very clear this great danger and how its menace may be often forestalled by early consultation with the family physician in every case of uncertainty

HERBERT L ODELL, *Secretary*

BRONX COUNTY

A regular meeting of the Bronx County Medical Society, held at Concourse Plaza, on October 16, 1929, was called to order at 9 P M, the President, Dr Aranow, in the Chair

The following candidates for membership were accepted Drs Henry H Blum, Philip Brown, Richard B Gross, Harold Jacobziner, Harris J Levine, Maurice C Rosenkrantz, Morris Rubinstein, George Schoenholtz and Adolph Schorr

The following resolutions were adopted by a rising vote

Whereas, The Bronx County Medical Society having attained a severe loss in the death of its honored associate, Herman Roth, M D

Resolved, That the Bronx County Medical Society record the sense of its loss in the death of Dr Herman Roth and that a minute thereof be placed on the records of the Society, and be it

Further Resolved, That a copy of these Resolutions be transmitted to the family of our departed member

Dr George B Stanwix, President of The First District Branch, addressed the Society on the subject of The First District Branch He spoke particularly of the excellent Scientific Program being arranged for the Annual Meeting to be held at Briarcliff Manor on Friday, October 25th, and urged the members to attend the meeting Dr Aranow supplemented the remarks of Dr Stanwix by assuring the members that it would be well worth their while to attend the meeting

Dr Frederic W Bancroft addressed the Society as the representative of the Greater New York Committee on Health Examination He explained in detail the purpose and plan of the Committee and appealed for the co-operation of the physicians in the Campaign for Periodic Health Examinations

The Scientific Program then proceeded as follows

Papers

1 The Basic Idealogy for a New Method of Hay Fever Prophylaxis and Allied Allergies (Preliminary Report), William A Wovschin

2 Recent Advances in the Treatment of Diabetes, Elliot P Joslin

Discussion on the Paper of Dr Joslin was then opened by Dr Adolph I Ringer

I J LANDSMAN, M D, Secretary

QUEENS COUNTY

A stated meeting of the Medical Society of the County of Queens was held at the North Hills Golf Club, Douglaston, on May 22nd, 1929 Following the custom in recent years the meeting took the form of an outing meeting and was held in affiliation with the Medical Association of the Greater City of New York During the day the Societies were tended the use of the golf links and in the afternoon a tournament was held in which the members and guests participated Drs E E Keet, J L Kane and H E Smith acted as Greens Committee In the evening the banquet was served at which 102 members and guests were present Following the banquet a short executive session of the County Medical Society was held at which president, W J Lavelle presided

Jacob Werne, M D, 10502 88th Avenue, Jamaica, was elected to active membership in the Society

The Secretary reported for the meeting of the Comitia Minora, who recommended the adoption of the following resolution submitted by the Medical Society of the County of Kings

"WHEREAS, Year after year bills have been introduced in the New York Legislature providing for a change in the public policy of the State with relation to birth control, either by repealing Sec. 1142 of the Penal Law which defines articles and appliances, etc., for this purpose to be obscene and providing punishment for their sale, distribution or use, or by the repeal of Sec. 170-d of the Public Health Law which forbids doctors violating the provisions of Sec 1142 of the Penal Law or abusing the privileges accorded them by Sec. 1145 of the Penal Law and

WHEREAS The New York City Federation of Women's Clubs sought, by questionnaire to secure endorsement of a birth-control bill in the 1929 Legislature from members of the medical profession and boasted of a number of affirmative replies, and

WHEREAS, It is reasonable to believe that effort will be made to secure endorsement of a birth-control policy

at the 1929 meeting of the Medical Society of the State of New York,

"THEREFORE BE IT RESOLVED, That the Medical Society of the County of Kings, in meeting assembled March 19th, 1929, reiterating its opposition to any change in the public policy of the State which will modify or nullify Sec 170-d of the Public Health Law or Sec. 1142 of the Penal Law, or that will amplify the privileges contained in Sec. 1145 of the Penal Law, or that will write the policy of sterilization of the sick or unfortunate citizens into the Law of the State of New York, hereby instructs its Delegates to the annual meeting of the Medical Society of the State of New York to present thereat, and work for the adoption of, the following Resolution

"RESOLVED, That the Medical Society of the State of New York, in (1929) meeting assembled, declares its opposition to the introduction or enactment of any law that will change the policy of the State of New York in the matter of birth-control or sterilization or so amplify the police power of the State as to threaten the money or man-power of the State, or its physical, moral or economic security, or the safety of its citizens, or to disturb the safeguards thrown about the practice of medicine in the State of New York as contained in the Medical Practice Act.

"AND BE IT FURTHER RESOLVED, That copy of this Resolution be sent to every County Medical Society in the State of New York with the request of this body that they take similar action to the end that a united front may be presented against those who may seek to make the medical profession the agency of lust and sadism through birth-control and sterilization"

The motion duly seconded the report of the Comitia Minora was accepted and the resolution adopted

The chairman, Dr Carl Boettiger, presented the following resolution for the Committee on Public Health and Public Relations and moved its adoption Seconded and passed

WHEREAS, The medical services in the various City Departments have developed to a state in which reclassification has become imperative in order that satisfactory medical personnel may be secured and retained,

AND WHEREAS the salaries paid have in most instances been inadequate, the best type of physicians to this work,

AND WHEREAS the Public Health Relations Committee of the New York Academy of Medicine has made a complete study of this matter and has rendered a report with recommendations, which report has been critically examined in the Public Health Committee of this society and submitted for approval,

THEREFORE, BE IT RESOLVED that the Queens County Medical Society endorse the recommendations made by the Public Health Relations Committee of the New York Academy of Medicine, and recommends their adoption by the Board of Estimate of the City of New York"

He further read a communication from the Medical Society of the County of New York, the adoption of which was recommended by the Comitia Minora and which had been referred to the Committee for their consideration and moved its adoption Seconded and passed

"By order of the Comitia Minora of the Medical Society of the County of New York, I transmit to you for consideration of your Society the following preamble and resolution which were adopted at a stated meeting of the Society

"WHEREAS, Periodic health examination is now recognized by the medical profession as playing an important role in the maintenance of public health, and

"WHEREAS, The New York County Medical Society believes that such examinations are best carried out under the guidance of the family physician,

"THEREFORE, BE IT RESOLVED that the New York County Medical Society invite the other county societies of the City to join it in the organization of a 'Health Examination Week' to take place in October,

"That the Commissioner of Health be asked to help organize a 'Health Examination Week.'

"That the public be informed from time to time through the press and other agencies of publicity of the purposes and details of such health examinations and

"That the Chairman appoint a committee of seven who with the Committee on Periodic Health Examinations, shall help to bring this plan into effect."

The Secretary called the attention of the members to the auto emblems and urged that they be generally used by the members He further called attention to the historical questionnaire in the current issue of the Bulletin and requested all physicians in the County to fill it out and forward it to the Historian of the Society

On the completion of the Executive Session, president Lavelle invited president E E Smith of the Medical Association to preside. Dr Smith spoke of the present relations that exist between the two organizations and expressed the appreciation of the Association for the opportunity of participating in this Joint Outing Meeting

Thereupon, president Lavelle introduced Hon. Richard S Newcombe, District Attorney of the County of Queens, who interestingly and ably addressed the assembled upon "The Relation of the Physician to the District Attorney's Office" In the course of his remarks he emphasized his own experience with psychiatrists who had rendered impartial services to the District Attorney in important cases during his tenure of office He further spoke of the participation of youth in the crimes committeed not only in the County of Queens but throughout the country, and considered the importance of training the boys of the County so that they would grow up into a right and healthful manhood Mr Newcombe's address was received with marked attention and it was apparent that he had made a deep impression upon the audience At the close, the presiding officer congratulated the County upon having a man in public office inspired with the high ideals and the forcefulness to execute them possessed by District Attorney Newcombe

In introducing the next speaker Dr Smith emphasized his eminence in the profession and the personal esteem in which he was held Dr Walsh then spoke on "Medical Quackery, Old and New," and both instructed and entertained the gathering with the astuteness and charm for which he is so widely famed

Dr Keet for the Greens Committee awarded

he prizes for the successful participants in the golf tournament

The meeting voted an appreciation to the host, Mr Endries, through whose courtesy the outing was held at the North Hills Golf Club

Attendance 102 E E SMITH, *Secretary*

QUEENS COUNTY

A stated meeting of the Medical Society of the County of Queens was held at the Oakland Golf Club, Bayside, L I, on Tuesday evening, September 24th, 1929, in affiliation with the annual meeting of the Queensboro Tuberculosis and Health Association It was preceded by a golf tournament in the afternoon and a dinner at 6 30 p m The meeting was called to order by president W J Lavelle, M D, who said in part

"This joint meeting of the Medical Society of the County of Queens and the Queensboro Tuberculosis and Health Association is but one more evidence of better understanding and the attitude of mutual helpfulness that is developing between the voluntary health agencies and the medical profession We physicians cannot afford to discourage or refrain from utilizing the valuable aid which is rendered by voluntary health agencies in the promotion of public health Their unhampered initiative is invaluable in developing pioneer measures for determining the most effective methods and technique in public health work Nowhere else is this spirit of co-operation better exemplified than here in the County of Queens where the County Medical Society is working hand in hand with the Queensboro Tuberculosis and Health Association for the common purpose of making our community a healthier and happier place in which to live"

He then introduced Mr Henry C Wright, president of the Queensboro Tuberculosis and Health Association, who presided at the executive session of the association

At the scientific session which followed, president Lavelle introduced Harry A Bray, M D Superintendent, Ray Brook State Tuberculosis Sanitarium, who spoke on "Essentials in the Diagnosis and Treatment of Pulmonary Tuberculosis" The discussion was participated in by Dr Carl Boettiger, president Henry C Wright, Drs E P Kolb, Brownstein, E E Keet, A L Voltz, Mr Godias Drolet of the New York Tuberculosis and Health Association and Dr T C Chalmers

Dr Keet, Chairman of the Golf Committee, awarded the prizes of the afternoon tournament, and Dr Chalmers addressed the meeting upon the Society building and announced the program for a bazaar in December

In the executive session the minutes of the last meeting were approved as published in the Bulletin, and the following members were unanimously elected, on ballot cast by the secretary

Active

Ludwig A Boehmer, M D, 9214 243rd Street, Queens Village

Benjamin Grossman, M D, Northern Boulevard and 153rd Street, Flushing

Arthur Schneller, M D, Boulevard Sanitarium, Astoria

Frances I Seymour, M D, 169 Beach Street, Far Rockaway

Associate Member

Jamie Benavides, M D, 224-02 137th Avenue, Laurelton, L I

Received by Transfer

M Trautmann, M D, 3760 82nd Street, Jackson Heights, from Milwaukee County (Wis) Medical Society

Dr T C Chalmers presented the following resolution which being seconded was unanimously adopted

RESOLVED, That the Board of Trustees be and they are hereby authorized to borrow from the Corn Exchange Bank Trust Company the sum of One Hundred Thousand Dollars ($100,000) in connection with the building program, and that no mortgage shall be placed upon the said property or building of the Society until this loan shall have been paid in full, and that the Chairman and Secretary of the Board of Trustees be and they are hereby authorized to sign a note for the payment of this loan and it is

FURTHER RESOLVED, That the Chairman and Secretary of the Board of Trustees be and they are hereby authorized to assign to the Corn Exchange Bank Trust Company, as security for the payment of said loan, all the subscriptions to the Building Fund in a form satisfactory to the Trust Company, and it is

FURTHER RESOLVED, That the action of the Chairman and Secretary of the Board of Trustees in signing and delivering a note to the Corn Exchange Bank Trust Company under date of September 18 1929, in connection with the building program and their action in assigning the Building Loan subscriptions to secure the payment of said note, be and the same are hereby ratified and approved

Dr F G Riley then read a letter inviting the Society to attend the meeting of the Associated Physicians of Long Island at the North Hills Golf Club, October 8th On motion by Dr Flemming, the secretary was instructed to acknowledge the invitation

The Secretary announced that at the meeting of the House of Delegates of the Medical Society of the State of New York held June 3rd and 4th, 1929, at Utica, New York, Drs Boettiger, Chalmers Courten, La Velle, Smith and Riley, regularly appointed delegates, were in attendance. He also announced the sale of auto emblems for members of the Society

Attendance 103 E E SMITH, *Secretary*

at the 1929 meeting of the Medical Society of the State of New York,

THE DAILY PRESS

LAWYER AND PHYSICIAN

The description of picking a jury in the trial of a former Superintendent of Banks, as recorded in the daily newspapers of New York City of October 21 and 22, has led Ding to record his impressions in a vivid cartoon in the New York *Herald Tribune* of October 22 The methods followed by lawyers are in striking contrast with those of the medical profession A lawyer is expected to guard the interests of his client, but both they and the judges often indulge in what seems to a physician to be an attack on the motives of the opposing side Jurymen are expected to come to court with open minds, but none can be found whose minds are blank The lawyer for the defendant evidently thinks that any information at all will prejudice a juryman against his client For example, The New York *Herald Tribune* of October 22 records the following "Were any of the newspapers you read with reference to the case favorable to Mr Warder (the defendant)?" "No" was the invariable answer Then the defending lawyer was quoted as saying, "Well, if you can think of any paper that was in favor of him, I wish you would let me have the name" Another question that was asked was "If I should advise the defendant at the end of the people's case that they had made out no case, and tell him not to take the stand would you hold that against him?"

All this would not seem to a physician to have any bearing upon making a diagnosis, which is what a jury is for

Choosing a Jury—A Medical Point of View
From the New York Herald Tribune, October 22, 1929

AERO AMBULANCE SERVICE

The New York Times of October 21 carried the following announcement of the very latest form of ambulance service, and said

"Colonial Flying Service and the Scully-Walton Ambulance Company have made an arrangement whereby patients can be rushed by air to New York hospitals for emergency treatment and operations The flying service will transport patients day or night between New York and any point having an adequate landing field Planes used will vary in type according to the nature of the case to be transported Fairchilds, Sikorsky amphibians and trimotored Fords will be available

"Colonial Airways System, of which the flying service is a subsidiary, it was said, has made a national arrangement through contracts with other ambulance companies either to bring patients from their homes to a field near New York or to transfer convalescent patients unable to endure the rigors of a slow train ride to their homes by plane from New York

"Cities where these arrangements have been made include Atlanta, Birmingham, Boston, Buffalo, Chicago, Indianapolis, St Louis, Oklahoma City, St Petersburg, Pittsburgh, Philadelphia and Springfield, Mass"

JOHN ROACH STRATON

John Roach Straton, D D, whose death was recorded in the Metropolitan dailies of October 30, was a man of conscience and convictions He was a fighting champion in a relentless war against Darwinism and evolution Doctors must admire the sturdy courage and uncompromising logic of the man He was no ascetic withdrawing himself from his fellows He was intensely human and practical. He resisted the devil in his strongholds, and studied him at first hand and close range in his native haunts in saloons and dance halls, so that law judges said of him, as they did of a greater religious leader nineteen hundred years ago, "This man receiveth sinners and eateth with them" Doctors commend his scientific way of studying the works of Satan by original observations

Dr Straton believed in Divine healing—and to him belief meant intense action He therefore instituted a clinic in his church—the Calvary Baptist—on 57th Street, New York, for the application of the principles of faith cure (See this Journal of December 15, 1927, page 1382) Whatever doctors may think of the experiment in faith cure, it was a valuable experiment from a scientific point of view, for it demonstrated how much, or how little, could be done by the method when applied by a devoted minister

Dr Straton was intensely active and he therefore took care of his health in a way described in the New York Herald Tribune on October 30

"The clergyman was six feet tall with broad shoulders and a slender but athletic frame He kept himself fit, as he thought, by an ascetic life and by swimming, horseback riding and calisthenics at home His face was lean and spare, with thin lips resolutely compressed, gray eyes, restless and alert, and gray hair brushed back from a high and lined forehead His years of oratorical and dramatic training had enabled him to affect a calm and repose, in order to heighten the effect when he delivered his oratorical thunderbolts, but an emotional storm was always raging within him under the fictitiously placid exterior

"The stress and strain, which was inspired in the crusader's soul by every contact with a world of which he strongly disapproved, caused the life of the pastor to become one long emotional crisis, undermining his constitution and bringing about his death at a comparatively early age, in spite of his attention to exercise and health"

Dr Straton made the common mistake of thinking that exercise is the great preventive of ills, and promoter of health and vigor He therefore trained his muscles, forgetting that muscular action involves work on the part of the nervous system that directs the muscles When Dr Straton did calesthenic exercises at home, he added to his brain fatigue What he needed was sleep rather than exercise

We wonder how a conscientious doctor would have advised Dr Straton after a periodic physical examination? But after all, what mattered it that Dr Straton died at the age of fifty-four, since those years were crowded with deeds whose accomplishment would require a century of effort by an ordinary man

---

AN APE FARM

A rat farm was described in our issue of October first, and one for angle worms on October fifteenth Now we call attention to an ape farm, which is described in the New York Times November first as follows

"The effects of pneumonia, influenza, tuberculosis and other human diseases upon anthropoid apes may be part of the scientific investigation to be carried on at the Yale University laboratory station soon to be established in Florida for the study and breeding of the anthropoids This information was disclosed yesterday by Dr Clark Wissler of the American Museum of Natural History, one of the members of a committee of scientists who have approved general plans for the foundation of the station

"Apes were subject to human ailments, Dr Wissler said, and added that it was hoped the science of medicine would be aided by a study of the effect of disease upon the animals and the efficiency of remedies employed

"Four chimpanzees, now at New Haven, would form the nucleus of the ape colony, Dr Wissler said A modest stock of gorillas, orang-outangs and gibbons would be procured through French and Belgian agencies

"The apes would be studied in life, Dr Wissler said, since the killing of an ape merely for scientific purposes was too expensive to warrant such procedure A captive gorilla was worth from $3,000 to $5,000, the donor estimated

"The establishment of the Yale station with its laboratory and staff of scientists is expected to obviate the previous difficulties of observers and reveal new chapters in the life histories and psycho-biological developments of these animals in their relation to man"

BOOK REVIEWS

MEDICINE. Its Contribution to Civilization By EDWARD B VEDDER, A M, M D Octavo of 398 pages Baltimore, The Williams & Wilkins Company, 1929 Cloth, $5 00

This treatise, according to its author, aims "to present the more important facts of preventive medicine accurately, but in plain English devoid of technicalities" It is therefore intended mainly for popular reading The reviewer cannot concur entirely with this point of view after perusal of the book

The book is a bird's eye view, not of developmental medical progress, but of actual medical accomplishments It is extremely well and interestingly written Its strong feature is the generous reference to vital statistics

If you have ever shunned statistical topics because of their dry figures you will find a new and delightful flavor in reading Vedder's book He has humanized vital statistics He has digested them for you and made them tell a story He has also furthered his purpose by dealing with them geographically

The layman cannot appreciate these deductions as well as the physician The numerous diseases dealt with may seem like a bewildering panorama to him One of the shortcomings of most popular medical books is the lack of illustrations

This book is semi-popular, but is an extremely valuable supplementary book for the practitioner and can well serve its purpose for the layman through the medium of the practitioner

EMANUEL KRIMSKY

THE INTERNATIONAL MEDICAL ANNUAL. A Year Book of Treatment and Practitioner's Index Forty-seventh Year Octavo of 568 pages, illustrated New York, William Wood & Company, 1929 Cloth, $6 00

This volume contains a review of selected papers on the subjects of medicine, surgery and the specialties which appeared during the year The abstracts are arranged conveniently under the subjects in alphabetical order The book is profusely and beautifully illustrated and well indexed.

FREDERIC DAMRAU

A SHORTER SURGERY A Practical Manual for Senior Students By R J McNEILL LOVE M B M S (Lond) F R C S (Eng) Octavo of 299 pages, illustrated New York, William Wood & Company 1929 Cloth, $4 00

This volume of 299 pages with 43 illustrations including 13 plates is well bound and printed on very excellent paper with clear type. The book was written essentially for the medical student, therefore, it is presented in a very condensed and crystallized manner It stresses especially classifications and systematic methods of clinical examinations The book will find its greatest purpose as an adjunct to the standard works on surgery

The commoner operations are described in a general but concise and didactic way Practically all of the usual surgical diseases are included As a book for the medical student and as a work for hasty reference, the reviewer highly recommends it

MERRILL N FOOTE

ARTIFICIAL SUNLIGHT AND ITS THERAPEUTIC USES By FRANCIS HOWARD HUMPHRIES, M D (Brux.), F R C P (Edin) Fifth Edition. Octavo of 340 pages illustrated New York and London, Oxford University Press, 1929 Cloth, $3.25 (Oxford Medical Publications)

This, the fifth edition of a valuable book, is a very welcome addition to our literature on light therapy Dr Humphries writes as an authority of long experience in physiotherapy, and is therefore well able to appreciate and correctly evaluate the newer developments in technique and apparatus The work includes interesting and highly instructive chapters covering the history, indications and contraindications, and methods of applying light and heat therapy The descriptions of apparatus are complete and unbiased The book is well written and clearly illustrated, and can be highly recommended to the reader

JEROME WEISS

COLLECTED PAPERS OF THE MAYO CLINIC AND THE MAYO FOUNDATION Edited by Mrs M H MELLISH and others Volume XX 1928 Octavo of 1197 pages, illustrated Philadelphia and London, W B Saunders Company, 1929 Cloth, $13 00

The 20th volume of the Collected Papers of The Mayo Clinic appears with 1197 pages and 288 illustrations It represents in one volume 429 papers published by members of the staffs of The Mayo Clinic during the past year Of these 429 papers, 81 are reprinted entirely, 43 are abridged, 72 abstracted and of 233 references only are given

It is impractical and unnecessary to review in detail the subject matter All those interested in owning or referring to this book are already familiar with its general type of contents The classification is in itself a huge piece of work and deserves much praise. It is arranged so that the general practitioner the diagnostic an and the general surgeon may refer readily to the subjects in which he is most interested by consulting the table of contents which is divided into 9 groups It is felt that every practitioner of surgery should have as a part of his literary armamentarium the collected papers of The Mayo Clinic

MERRILL N FOOTE.

THE ORIGIN OF MALIGNANT TUMORS By THEODOR BOVERI Translated by MARCELLA BOVERI Octavo of 119 pages Baltimore The Williams & Wilkins Company, 1929 Cloth, $2 50

A zoölogist places before the scientific world for reconsideration, the association of mitoses and tumor origin. He assumes that the qualities of malignant cells have their origin in an irreparable defect in the chromatin content of the nucleus Any chromosome combination varying from the normal is termed "chromatin complex" To this he attributes (a) the unlimited power of cell reproduction—a reversion of the cell back to its embryonal egoistic status," and (b) the altered metabolism in the tumor cell—causing an altered reaction in the environment These nuclear defects are the results of assymetrical mitosis or of multipolar mitoses, through the influence of chronic irritation. By their ability to loosen or dissolve the normal connection with each other he explains metastasis

The author clearly presents the evidence stressing the possibilities of his theory, and attempts to disprove all opposing views

HARRY MANDELBAUM

OUR NEIGHBORS

CIVIC MEDICINE

The practice of civic medicine is the most frequent subject that is discussed by officers of medical societies It is universally recognized that a physician does not do his full duty to the state which licenses him unless he discharges his civic obligations along medical lines This obligation is at the basis of the work of the Committee on Public Relations of the Medical Society of the State of New York, which has developed methods of the practice of civic medicine to a greater extent than has any other medical society in the United States

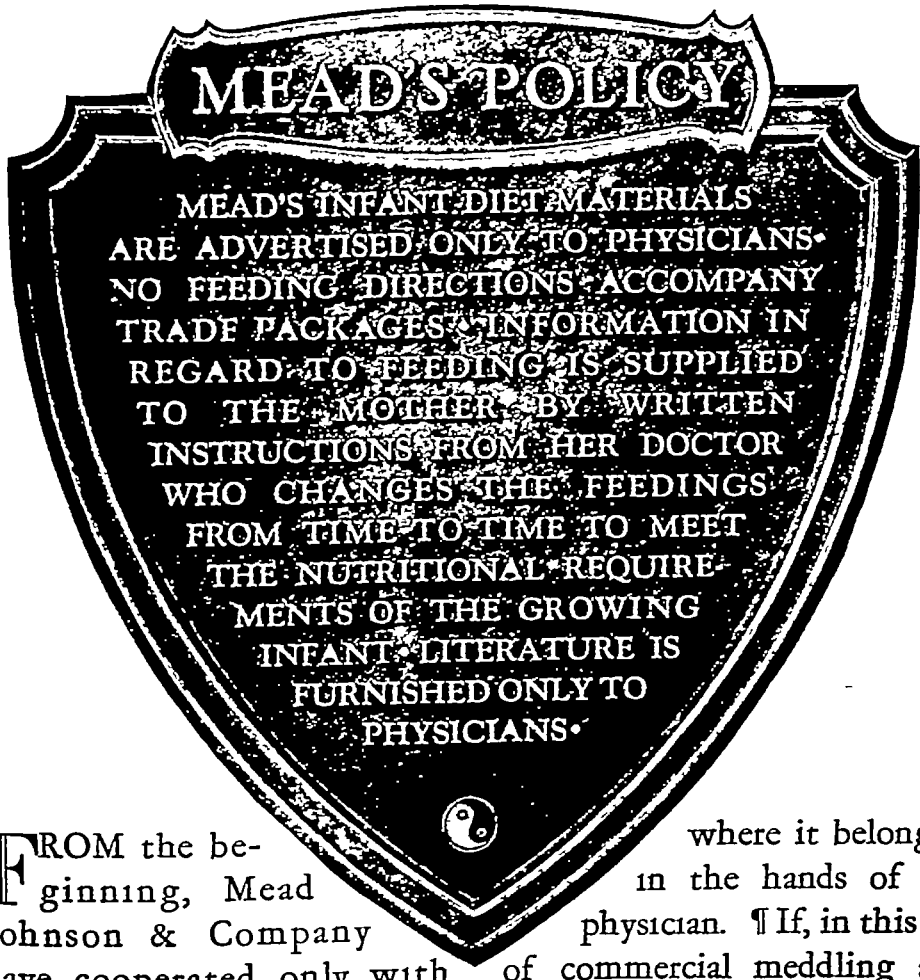
The leadership of physicians in civic medicine is the subject of the Chairman's address, by Dr Stanley H Osborn of Hartford, Conn , before the section on Preventive and Industrial Medicine and Public Health of the American Medical Association on July 10, 1929, as recorded in the *Journal of the A M A* , of October 26 Dr Osborn said

"As to the duty of the physician to the community—should he remain strictly aloof and tend to his knitting? Should he ignore requests for his presence on the local board of health or different committees of local societies? Should he refuse to become a member of this board or that society, merely to keep out of imaginary politics or because it will take a little of his time? He most certainly should not Not only the physician but the medical societies should be actively interested in these community affairs

"It is realized that a small percentage of physicians in the country is doing essentially what has been outlined It is my object in this paper to keep this phase of preventive medicine in the forefront of the practice of medicine

"I have been stressing the duty of the private physician There are similar duties of the official and of the voluntary health agencies The most important duty of the latter two groups is to aid the physician in carrying on his work in this preventive line and not to carry out a single piece of preventive medicine that the physician can do and should do

"If it is felt that the physicians in a community are not doing their work, it is not the duty of the department of health or voluntary agencies to assume at once the neglected activity until they have earnestly and conscientiously brought the matter to the attention of the physicians and tried to have the physicians of the community assume the burden The establishment of clinics in a neighborhood through excessive enthusiasm and lack of foresight may lead to unnecessary friction and an irreparable conflict of opinion A few seeds of cooperation planted before a clinic is established will be far more productive for the health of the community We, through our societies, should endeavor to spread the practice of individual preventive medicine much more than is now being done. It does not appear practicable or desirable to leave to another group of possible specialists the practice of preventive medicine which is the field of the general practitioner the family physician"



DELAWARE'S ANNUAL MEETING

The September issue of *Delaware State Medical Journal* contains the program of the annual meeting which was held October 8-10, 1929, in the Delaware State Hospital at Farnhurst Concerning the meeting and the officers' apprehension over the attendance, the Journal says editorially

"Delaware has the third oldest Medical Society in the United States, of which most of the physicians of the State are members At any rate, they have paid their dues But true membership implies more than paying a stated sum every year, it means a personal interest in all of the activities of the Society The business and social affairs are not those of a small group, but of the whole An individual does not invest his money in a business and then neglect it. He watches carefully, making sure that he gets full returns for the amount invested Is each physician doing his best to get full returns from his organization? To obtain the fullest value each must take an active interest in all affairs, both scientific and business Attendance during the lest few years has been such that at times there have been too few delegates present to open the meeting The officers have tried their best to make the program interesting, and it would seem that it were the duty of every member to make a serious attempt to attend the meeting and to discuss the papers And not only should they attend the scientific meetings, but they should also take an active interest in the business meetings, and present suggestions to improve the Society and to obtain perfect cooperation between the various County Societies

"Each member should do his utmost to aid his officers in their work Over one hundred letters

(*Continued on page 1422—adv xii*)

FROM the beginning, Mead Johnson & Company have cooperated only with physicians, never advertising to the public, never enclosing descriptive literature with packages, never printing directions on packages, nor exploiting the medical profession in any way. For years, we have thrown all our resources in research, money and honor into keeping infant feeding where it belongs—in the hands of the physician. ¶ If, in this day of commercial meddling and gratuitous medical advice, the Mead policy is in the interest of the medical profession's own future, should it not have your whole-hearted active as well as passive support? Your use of Dextri-Maltose and other Mead products reflects your approval of this policy Is it worth your while?

MEAD JOHNSON & CO, Evansville, Ind, U S A—*the strictly ethical house*

The Follow-Thru Of Your Instructions

THE physician who prescribes exercise for his patients is generally too busy to follow thru his instructions to see whether the prescription is being carried out—or neglected

The physician who takes the extra precaution of sending a client to McGovern's Gymnasium for exercise and re building has the assurance that his exercise prescription is being carried out to the letter, and that he can follow the progress of his patient by regular reports

A work out at McGovern's will show you why so many physicians send patients here We'll be glad to send you a guest card

have been written to various local men asking them to prepare papers for the coming meeting Some members have received two or more letters The majority of these were not even answered By reading the program one can see that out of seventeen papers about 50 per cent are local

"Let each member try his best to make this Society of the type that gives value received to all who attend its meetings"

HEALTH PROGRAM AT THE NEBRASKA STATE FAIR

The October issue of *The Nebraska State Medical Journal* has the following editorial account of an exhibit conducted by the State Medical Society

"The Public Activities Committee of the Nebraska State Medical Association, under the able, energetic and enthusiastic leadership of Dr E R Hays, of Falls City, has this year sponsored a program at the State Fair well calculated to bring home to the people the practical value of health preservation and disease prevention Public health lectures, moving pictures, exhibits, attractive posters, physical examinations for children and for adults constituted the means of medical education for the layman

"The extensive program called for the cooperation of many physicians All those called upon responded with promptness and enthusiasm Year by year the Nebraska State Medical Association receives better and stronger representation at the State Fair In view of the very large number of people who are daily visitors, the Nebraska State Medical Association has a fine opportunity of laying before the people of the state the possibilities for health inherent in the periodic examination and the importance of early medical and surgical intervention in the hopes of preventing the graver and more serious consequences of neglect

"An added feature of this year's program was the health lectures offered to the public at the State Fair One lecture was scheduled for the Monday, Tuesday, Wednesday, and Thursday of the week in which the Fair was held

"As an example of the subject matter and the type of presentation suitable for popular discussion we append some of the subjects discussed

"Some Preventable Diseases—Dr P H Bartholomew, Lincoln, Director of State Health

"Personal Hygiene—Dr B Carl Russum, Professor of Pathology and Preventive Medicine, School of Medicine, Creighton University

"Common Sense in Medicine—Dr Lucien Stark, Norfolk '

ADVERTISING IN STATE JOURNALS

A comparative estimate of the costs of the several State Medical Journals is difficult to make, for some pay no salaries or rent The cost of the *Texas State Journal of Medicine* is discussed editorially in the October issue, which says

We are not going to say a great deal on this subject at this time, as important as it is We have it in mind to go into this matter rather exhaustively sometime in the future, in order that our readers may be informed We are interested because our readers are our owners, and they are not only concerned with the character of reading matter and the amount of it that we give them, but with the financial success and, therefore, perpetuity of the publication as well

"Last year the Journal lost $360 75 That deficit could have been avoided by a reduction in size and quality, but the trustees thought it best to maintain the standards they had set, if the losses were not greater than that It is the intention of the trustees to put back into the Journal every dollar that it makes, but the effort is to make a small profit each time, in order to insure against the expensive numbers when they have to be published, which is in keeping with good business principles

"The trustees will guarantee to print a journal better than that which is printed now, and make a handsome profit, from which much of the cost of running the association may eventually come, as is the case now with the American Medical Association, if our readers will give some attention to our advertising business Surely that is not much to ask There is not an Ad in the Journal, from cover to cover, which is not strictly in accord with medical ethics, from whatsoever angle, and none of our advertisers will ever defraud any of our readers Not only do we approve the advertising we carry, but we practically guarantee that it is what it says it is Therefore, our readers may in perfect good faith boost our advertisers Certainly they can afford to patronize them, and should do so And doing so, most certainly they should let the advertiser know it Otherwise we do not get the credit that we need, to maintain the business"

COUNTY SOCIETY NEWS

The problem of getting news from County Medical Societies is universal among editors of State Journals An editorial in the October issue of *Texas State Journal of Medicine* says

"The publication of County Society news is one of the most important functions of the Journal It is intended that these items serve the dual purpose of passing around current discussion, and of making of permanent record the medical

(*Continued on page 1424—adv xiv*)

BabyGain—Prepared from Pure, Fresh Tuberculin-Tested Milk within a few hours after milking

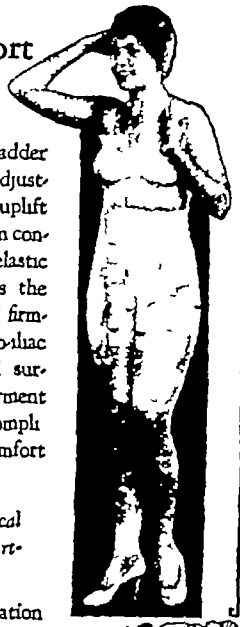
Pure, Fresh Milk from Healthy Tuberculin-Tested Cows, Modified and Powdered

BabyGain—made from fresh tuberculin-tested milk produced under rigid sanitary control, modified and powdered a few hours after milking—besides being a correctly balanced food for all babies—is especially valuable in cases where breast feeding needs to be supplemented

Hospitals, nurses and physicians have found this powdered, modified milk the ideal substitute for mother's milk

BabyGain requires only the addition of water to provide an infant diet that conforms both chemically and characteristically to the average human milk and may be readily adjusted to meet individual requirements

BabyGain—packed in hermetically sealed containers —will keep fresh in any climate



The only fat in BabyGain is the natural butterfat in the pure, fresh tuberculin-tested milk from which it is made

affairs of this day and time How nearly we accomplish either or both of these important purposes, depends mainly upon the county society reporter If a county society has an active, interested and competent reporter, results will be just as satisfactory as are the transactions of the society reported upon If there is no society reporter, or the member designated to assume this rather important duty does not function, the results will be unsatisfactory, as a matter of course The editor of this department in the Journal will do his best to work into proper shape any material sent to him, no matter how much trouble it may be The editor can blue-pencil material but he cannot add very much Frequently it is necessary to blue-pencil material that perhaps a better understanding of the situation might easily enable him to save, but contingencies of that character cannot be very well avoided Not all doctors are good reporters Indeed, it seems that for educated men, they strangely lack in literary accomplishments

"We have frequently been asked why the Society News columns do not carry reports from certain societies There can be but one answer, we do not get them We will be glad to have them, including personal items relating to members Very naturally, there are personal items of purely local interest which we would not be justified in publishing, but, on the other hand, many personal items may be of interest to other parts of the state, and of that the editor is perhaps the best judge Now that the season of greatest activity of county medical societies is approaching, we would urge that this is one of the important matters to be given consideration"

PERIODIC HEALTH EXAMINATIONS IN TEXAS

A campaign to popularize periodic health examinations has been started in Texas according to the leading editorial in the October *Texas State Journal of Medicine*, which says "President Dr Dildy has chosen for the major theme of his administration, the problem of periodic physical examination He has asked the Executive Council to authorize a publicity campaign embodying this idea, at least as the principal subject. The Executive Council has, after thoroughly discussing the proposition, given its warm and enthusiastic approval of the plan set out by the president, and committees are busy at the present time working out details The first several weeks of the campaign will be within the medical profession, with occasional excursions into the forums of the lay public, as opportunity offers, with a concentration on such forums thereafter and until, possibly the

(*Continued on page 1425—adv xv*)

(*Continued from page 1424—adv xiv*)

State Board of Health is in a position to take over leadership and assume responsibility

"It is intended that each organization in the state interested in public welfare work, and no public welfare work can be independent of public health, will be interested in the movement and its cooperation sought It is hoped that the State Health Department will find itself in a position to assume leadership, eventually if not now Indeed, plans are under way looking to the employment of a trained campaigner by the State Board of Health If these plans work out satisfactorily, there would seem to be no reason why President Dr Dildy should not place the machinery of the State Medical Association, and the organization now being perfected for carrying on this campaign, at the disposal of the State Board of Health and accept its leadership"

DOCTORS' CARDS IN STATE JOURNALS

The Department of Our Neighbors on page 1164 of this Journal for September 15, contains an abstract of an editorial which appeared in the August issue of the Journal of the Tennessee State Medical Association announcing the acceptance of doctors' cards in the advertising section of the Journal The October issue of the Journal carries twelve cards, and its editorial department says

"In this issue there appears a new department of the Journal, namely, the Directory Department

"In the August issue this matter was discussed editorially For complete information on the subject we would refer readers to that editorial It suffices to say at this time that this matter was submitted to the Board of Trustees and approved It was submitted to the House of Delegates of the State Association and approved The individual cards will be approved by the advertising committee No boastful claims of superiority on the part of any person will be published, of course.

"A number of our best state journals run a directory such as this department of the Journal will be

"As before stated, this office has no intention of putting on a high pressure sales campaign The department is open and is available to all members We would be glad to run the directory department in such a way that no member can take offense The rates for each card are on the basis of one-tenth of one page for twelve months, which is $4 50 per quarter"

ILLINOIS EDUCATIONAL COMMITTEE

The October issue of the *Illinois Medical Journal* contains the following report by Secretary Jean McArthur on the educational activities of the Illinois State Medical Society from June first to October first, 1929

'Twenty physicians were scheduled to give scientific papers before thirteen county medical societies of Illinois and a staff meeting at St Francis Hospital, Indianapolis, Indiana. A crippled children's clinic was arranged for the Perry County Medical Society

'Fifty health talks were given by physicians before men's service clubs, Home Bureaus, Teachers' Institutes, Graduation Exercises of Nurses, Parent-Teacher Associations, Women's Clubs, and High Schools

'Forty-nine appointments for health talks have been made for the next few weeks These talks will include nine on diphtheria prevention to be given in DuPage County in connection with a county wide diphtheria immunization campaign, four health meetings at Farmers' Institutes, and fifteen senior high school assembly periods

"A series of ten health lectures is being arranged for the South Chicago Y M C A These meetings will be open to the public and the talks will be illustrated with moving picture films Suitable educational articles on the topics to be discussed will be used in the local newspapers

"Thirty-four radio talks have been given by members of the Chicago Medical Society over stations WGN and WJJD

"One thousand six-hundred and ninety-six health articles were released covering the regular service the committee is giving to about one hundred newspapers in the state

"One thousand one hundred and seventy four special articles on diphtheria and smallpox were sent to all newspapers in the state

"Four hundred and thirty-two news items were released to newspapers announcing the Annual Fall Meeting of the Schuyler County Medical Society at Rushville, the Tri-County Medical Meeting at Kewanee, and the Crippled Children's Clinic in Perry County

"Fifty-three educational health articles have been written and approved by the members of the Educational Committee The wide range of subjects covered afforded suitable articles for release during the summer Fireworks, Mother's Vacation, Watch Out for Poison Ivy, Broken Bones, Poisonous Snakes, Fire and Burns, etc

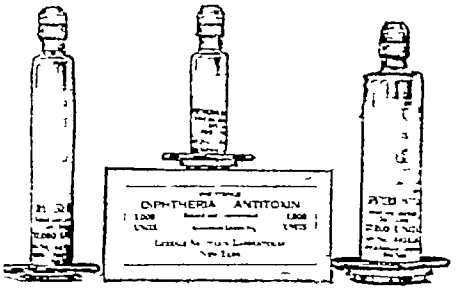
"The Educational Committee has received reports from chairmen of summer round-up committees responsible for promoting the pre-school child examination, which show that in many communities parents prefer to have this work done by the family physician"

LOAN FUND FOR MEDICAL STUDENTS

The October issue of the *Kentucky Medical Journal* contains an article on a plan devised by the Kentucky State Medical Association for loaning money to medical students It says

'The House of Delegates at the Richmond Session authorized the President to appoint a committee to solicit funds for a student loan to be made available to any Kentuckian who desires to study medicine and needs financial aid This forward movement to assist our own boys and girls is in line with what other organizations are doing The Western State Normal, The Parent-Teachers Association, Federation of Women's Clubs, and The Council of Jewish Women have scholarship student loan funds and report that there has rarely been a student that did not refund the loan

'The funds will be accounted for in the same detailed manner that all the finances of the Association are managed A list of donors and amounts will be published in the annual number of the Journal The awards of scholarships will be made by the committee This money will be loaned to the students and they will be given ample time to repay it We hope by this means to assist worthy ambitions We are asking each County Society to raise $25 00 for this fund, and any private donations will be gladly accepted"



EXTENSION WORK IN OKLAHOMA

How a group of doctors in one county in Oklahoma took on extension courses is told in the following editorial in the October Journal of the Oklahoma State Medical Association

"A phase which may not have occurred to many localities and which, so far as is known, has only been put in practice in Muskogee County, and which it is believed will prove of great benefit to those physicians participating, is that of affiliation with the Extension Department of the State University In the Muskogee County case, 14 physicians secured nine weeks of dissection, surgical anatomy and some cadaveric surgery at a very nominal sum This did not interfere to any degree with their work and was executed at night so there was very little interference with the normal routine of the individual It is believed that where one or two localities can organize such classes and induce the aid and cooperation of the University Medical Department that very great and lasting benefit will result for those participating

'The object of this is to attempt to induce County Society Officers to stimulate their members to immediate activity along whatever medical lines they deem most beneficial"

COUNTY SOCIETIES CARING FC INDIGENT POOR

The department of "Our Neighbors" in Journal of June 1, 1928, page 693, containe abstract of an article by Dr Olin West on the of the indigent poor of a county by the cc medical society acting under a contract witl Board of Supervisors This Journal of Fe ary 15, 1929, abstracted an editorial on the subject from the *Journal of the Iowa State M cal Society,* in which five counties are liste having such contracts, and three others as sidering them The plan must be meeting th proval of physicians, for the October issue o *Iowa Journal,* page 472, says

"Scott County Medical Society met Tue evening, September the 3rd at 8 p m at the Cl ber of Commerce There were twenty-six n bers present Dr Bessmer, president, presid

"The question of Scott County Society ma a contract with the board of supervisors for care of the county poor was taken up, and a thorough discussion both pro and con, a mc carried that the president appoint a committe investigate, and report back at the next mee as to plans and arrangements that could be m This motion carried with it also, authorit spend what funds were found necessary in t investigation The committee appointed consi of Drs Marker, Hand, Bendixen, H Lamb Matthey, L A Block, and George Braunlich."

MEDICAL DEFENSE IN GEORGIA

Medical defense is discussed in the Octc *Journal of the Medical Association of Georgi* the Chairman of the Committee, Dr M A Cl who reported

"A few years ago suits were very much m numerous Since we have adopted the present p of medical defense they have been greatly sened Since 1916 we have never lost a case t has come to trial, and have had many ca thrown out of court. Of the nineteen suits n pending the smallest is for $10,000 00, the larg for $100,000 00 No member of the Commit has ever received a cent of money for expense anything else The entire appropriation has b expended in the defense of suits The Commit has made every possible effort to keep the expe down, but with the number of suits now pend it will be impossible to get along with less th the usual appropriation of $3,500 00

"We, as a Committee, are rather proud of t value of this Committee to our membership, a we heartily approve the action of the Associati As a matter of interest it may be well to tell y that the suits have been almost equally divid among the cities and rural districts The citi have no preference, as is sometimes thought Tl medical profession as a whole is getting the ben fit in the defense of these suits

GEORGIA STATE JOURNAL

The cost of the *Journal of the Medical Association of Georgia* is given in the report of the Secretary-Treasurer to the House of Delegates on May 7, 1929, and recorded in the October Journal, as follows

"During this year the Journal has contained a total of 904 pages at a total cost of printing and mailing of $5,702,58 as compared with 800 pages at a cost of $5,986 64 last year In other words, it has contained 54 more pages but has cost $284 06 less than last year However, its income from advertising showed a decrease of $874 46—being $6,071 09 last year and only $5,196 63 this year Our advertising has been strictly limited to those products accepted by the Council on Pharmacy and Chemistry of the American Medical Association

"In figuring the profit and loss on the Journal we have credited it with the regular subscription of three dollars per paid member, independent subscriptions by non-members at three dollars each and advertising We have charged to the Journal account the total cost of printing and mailing the Journal, one-half the general postage account, one-half the rent, salaries and all other general expense of the office of the Association After all of this was deducted we had left a profit of $1,861 28 in the Journal account for this year

"In view of the above facts I again recommend that, as soon as practicable, the Journal be given a separate account and be allowed to use its surplus for improvements and enlargements"

MEDICAL SPEAKERS

A number of State Medical Journals have recently criticized the poor enunciation of speakers at medical societies, but Dr H A Jones, writing in the October *Rhode Island Medical Journal,* praised the speakers at the Maine Medical Association, as follows

'The papers presented were replete with the latest advances of medical science and the discussions which followed the readings of these papers were lucid, logical, and very instructive, and were read and discussed in plain English

"The meeting was conspicuous by the absence of the 'cup eared,' or hand-to-ear listeners in the assembly hall where the papers were read, and this was, no doubt, due to the acoustics of the hall, or to the absence of those monotone, monologue artists, who, charmed with the cadences of their own cogitation, often fail to impress a strained and listening audience

Matching the Blood Stream

IN a therapeutic substance it is not always practicable or even desirable to match the blood, because the blood stream is not only the food supply of the cells but also their outlet system for waste products.

Take a systemic alkalizer, for instance. It should contain neither sulphates nor lactates, as the former is a decomposition product and the other a fatigue product in the circulation

ALKA-ZANE

furnishes potassium, sodium, calcium and magnesium in the form of *phosphates, carbonates* and *citrates*

For a practical understanding of its merits, let us send you a liberal quantity of Alka-Zane.

WILLIAM R. WARNER & COMPANY, Inc.
113-123 West 18th Street, New York City

Rheumatic Diseases

Sciatica, Arthritis, Lumbago, Neuritis and Gout Treated Exclusively

Safe, successful, balneological and physiotherapeutic methods are employed, where indicated

SHANNON LODGE is centrally located and fully equipped Rheumatic patients accepted only Limited accommodations are carefully restricted All treatments under the intimate supervision of the Resident Medical Director Reports available to referring physicians, who may at all times retain contact with patients A completely equipped pathological laboratory supplements diagnoses and treatments. Reservations necessary in advance Inspection cordially invited

120 acres, 800 ft elevation, 20 mile view Forty-two miles from New York Golf, tennis, riding Tastefully, yet unostentatiously furnished Large suites available Atmosphere of a fine country home

Shannon Lodge
Bernardsville, NJ

Complete information, rates, treatments used, etc, gladly sent upon request to the Medical Director

Mellin's Food
in
Difficult Feeding Cases

In difficult feeding cases commonly known as Marasmus or Malnutrition, the first thought of the attending physician is an immediate gain in weight, and then to so arrange the diet that this initial gain will be sustained and progressive gain be established

Every few ounces gained means progress not only in the upward swing of the weight curve, but in digestive capacity in thus clearing the way for an increasing intake of food material

As a starting point to carry out this entirely rational idea, the following formula is suggested

Mellin's Food . . .	**8 level tablespoonfuls**
Skimmed Milk . . .	**9 fluidounces**
Water	**15 fluidounces**

This mixture furnishes 56 6 grams of carbohydrates in a form readily assimilated and thus quickly available for creating and sustaining heat and energy The mixture supplies 15 5 grams of proteins for depleted tissues and new growth, together with 4 3 grams of mineral salts which are necessary in all metabolic processes These food elements are to be increased in quantity and in amount of intake as rapidly as continued improvement is shown and ability to take additional nourishment is indicated

A pamphlet devoted exclusively to this subject and a liberal supply of samples of Mellin's Food will be sent to physicians upon their request

Mellin's Food Company - - - Boston, Mass.

MALARIA IN GEORGIA

The October *Journal of the Medical Association of Georgia* ays that the Committee on Health nd Public Instruction of the Medical Association reported to ne House of Delegates the prevlence of malaria as follows

"We all know something of our Georgia Legislature and know ow difficult it is to raise money or any purpose, except for the uilding of roads, which we seem o do very successfully We have our cents per capita for health in Georgia In North Carolina they ave seventeen cents per capita, nd in other states much more During the last year we had 87 per ent increase in malaria over 1927 We had many deaths from malaria ast year, every one of which we ould have prevented had we had the necessary funds, and if we can get to Congress and get them to give us dollar for dollar, or anything they will advise that will give us an opportunity to rid Georgia, North Carolina and other states of the greatest bar to our health and our success, we can accomplish much If we can do anything that will enable us to achieve that desire, it seems to me it will be the most wonderful thing that has happened since I have known anything about Georgia"

The House of Delegates voted to ask Federal aid in eradicating malaria

ENDOWMENT OF THE WISCONSIN MEDICAL SOCIETY

The October issue of the *Wisconsin Medical Journal* contains the following editorial description of the endowment fund of the Wisconsin Medical Society

"By two enactments of the Wisconsin legislature and action of the Council and House of Delegates of the State Medical Society of Wisconsin, the Foundation Fund of the Society has been brought into being for the advancement of medical science The Council is now empowered to accept donations and bequests and it is understood that a substantial sum has already been nominated for this fund in the wills of but two members

"In the years to come the interest that may accrue from such gifts will be used by the State Medical Society to advance Wisconsin medicine in all of its aspects Gifts may be made in the names of the donors or as memorials, with the interest to be used either for a specific purpose named by the donor or for such purposes as may seem fitting from year to year by the Council of the Society Undoubtedly the near future will bring to this fund gifts and bequests, small and large, from many members who will wish, in such manner, to return for the direct advancement of Wisconsin medicine some token of what the profession has brought and meant to them

"We commend the establishment of this fund as a far sighted action on the part of the State Society and legislature To the members we suggest that it affords an opportunity for a becoming, productive and enduring bestowment."

HEALTH WORK AT A STATE FAIR

The September issue of the *Nebraska Medical Journal* has the following editorial on health work at the State Fair

"As you know the state health work and exhibits at the State Fair are now under the supervision of the Nebraska State Medical Association We have been putting in some extra work on the proposition this year, and are really desirous that the doctors of the state visit that department

"We have the examinations for adults, the four H club, the babies, and some exhibitions, lectures, and reels on contagious diseases, particularly diphtheria prevention In the babies department we are planning for some reels and slides in addition to the examinations of the babies, and possibly some lectures We have really put a good deal of work on the proposition this year and are desirous of constructive criticism"

If you believe that

"The Best Is None Too Good For Babies"

THE MODIFICATION OF POWDERED MILKS GOVERNED BY THE SAME RULES AS COW'S MILK

When physicians are confronted with undependable fresh milk supplies in feeding infants, it is well to consider the use of reliable powdered whole milks such as the well-known Mead brand Such milk is safe, of standard composition and is easily reliquefied

Under these conditions, Dextri-Maltose is the physician's carbohydrate of choice just as it is when fresh cow's milk is employed.

The best method to follow is first to restore the powdered milk in the proportion of one ounce of milk to seven ounces of water, and then to proceed building up the formula as usual. See page ix.—*Adv*

BABYGAIN

BabyGain—made from fresh tuberculin-tested milk produced under rigid sanitary control, modified and powdered a few hours after milking—besides being a correctly balanced food for all babies—is especially valuable in cases where breast feeding needs to be supplemented

Hospitals, nurses and physicians have found this powdered, modified milk the ideal substitute for mother's milk.

BabyGain requires only the addition of water to provide an infant diet that conforms both chemically and characteristically to the average human milk and may be readily adjusted to meet individual requirements See page xiii —*Adv*

A NEW POST-OPERATIVE SUPPORT

A new Camp garment particularly designed for physiological support following stomach or gall bladder operations The Camp Patented Adjustment provides support and proper uplift where needed It insures diaphragm control without restriction The elastic insert at operative point supplies the required softness without loss of firmness, and gives satisfactory sacro-iliac support. Leading physicians and surgeons everywhere endorse the garment as a preventive of post-operative complications, and praise the extreme comfort it affords the patient. See page xiv—*Adv*

INSULIN (SQUIBB)

Insulin Squibb, like other Squibb products, has the merited approval and confidence of physicians everywhere. It is prepared under license from the University of Toronto and conforms to the standards established and maintained by the Insulin Committee

Insulin Squibb is accurately standardized, uniformly potent, highly stable. It has a particularly low nitrogen content and is remarkably free from reaction-producing proteins See page viii.—*Adv.*

VITA GLASS FOR ALL SEASONS

To children convalescing at the New England Peabody Home, Vita glass transmits the invisible health rays of the sun—the ultra-violet rays in the vital range which scientific tests have proved a chief source of health and development.

A short seasoning-period, and the ultra-violet transmitting power of Vita glass becomes constant at a point where the transmission of an efficient volume of health-giving rays is assured. And this holds true not merely during the sunny months Tests conducted for the past two years by Walter H. Eddy, professor of Physiological Chemistry Teachers College, Columbia University, show that sunlight coming through seasoned Vita glass in the month of *February*, in *New York City*, exerts a completely anti-rachitic effect.

Dr Eddy's experiments prove further that *three hours daily exposure* to winter sunlight coming through Vita glass gives thorough anti-rachitic protection. Beneficial results have been gotten with Vita glass and winter sunlight by the American Medical Association's Council on Physical Therapy, Captain William D Fleming of the Army Medical Corps, and other scientific bodies and individuals Confirming these experiments are reports on Vita glass in practical use in hospitals and sanatoria throughout the country More than 250

THE GRADUATE FORTNIGHT OF THE NEW YORK ACADEMY OF MEDICINE

By FREDERICK P REYNOLDS, M D

Medical Secretary, Committee of Medical Education New York Academy of Medicine

THE Second Annual Graduate Fortnight of The New York Academy of Medicine which was held October 7th to 19th, 1929, on the general subject of "Functional and Nervous Problems in Medicine and Surgery," met with very gratifying success There was a large attendance both at the afternoon clinics held in the hospitals and at the evening meetings held at the Academy Applications for tickets of admission to the clinics were greatly in excess of the tickets available These applications came from many doctors living some distance from New York The average attendance at the evening meetings was 545

On account of the subjects discussed and the prominence of the speakers considerable interest was taken in the Fortnight by the general public This was evidenced by the space which was given to it in the daily press A number of Metropolitan papers published editorials on the Fortnight as did papers and periodicals of other parts of the country

The papers of the Fortnight will be printed in full in the monthly Bulletin of the Academy

Abstracts of some of the papers are presented herewith

DR. WALTER LANGDON BROWN, Physician to St Bartholomew's Hospital, London, discussed the part taken by the involuntary nervous system in many diseases, both organic and functional, in an address on "The Involuntary Nervous System"

After sketching the history of the discoveries of Gaskell and Langley as to the persistence of primitive methods of response in the involuntary nervous system, etc., Dr Brown said that "it is abundantly clear that however the sympathetic nervous system is brought into action it at any rate stimulates certain emotions and preeminently the emotion of fear

"That many psychoneuroses are based on a repressed or subconscious fear is now clearly recognized Fear, whether of evil spirits, of magic or of the dark, panic fear dominated primitive man and, whenever our resistance is lowered by disease, by shock or by psychic conflict, we betray our ancestry That strange primitive being which lurks in the unconscious mind of us all, peeps out

"Without in any way excluding the possibility of structural changes in the sympathetic nervous system, sometimes being responsible for manifestations of its action in disease, we are certainly justified in stating that a state of continued fear, whether recognized or not as such by the sufferer, is capable of producing symptoms of which they so generally complain Moreover, I believe that the great majority of such manifestations are of that order

"'Emotion moves us, hence the name,' said Sherrington It would perhaps be more accurate to say that it is designed to move us When under conditions of modern life emotion is dissociated from the movement it should evoke under more primitive conditions, the sympathetic disturbances may continue The mobilized army which is not allowed to fight the enemy becomes a danger to its own country The animal that is restrained from fight or flight suffers from an increased fear

"Nervous impulses tend to run along accustomed channels as Herbert Spencer pointed out The exciting cause may long have passed from the realm of consciousness but its effects may continue Designed for an intensive preparation for action or defense the sympathetic response may be dissociated, perverted or prolonged

"We are beginning to work out interesting associations between the nervous and biochemical aspects of this subject particularly in relation to blood sugar The thyroid, adrenals and pituitary can each be brought into action through the sympathetic and they are each antagonistic to insulin, raising the level of sugar in the blood Thus an emotional glycosuria may result, and I am fond of quoting Crile's phrase 'When stocks go down in New York diabetes goes up'

"'Man is not a reasonable creature, he is merely in process of becoming one,' says H G Wells

Many of our responses are unreasoning The art of medicine is to come to the aid of such responses by interpreting their meaning 'From the pain of the individual we learn lessons which we apply to the benefit of the community at large'"

The subject of "Neuroses Following Accident" was considered by Dr Foster Kennedy, Professor of Neurology at Cornell University

Dr Kennedy warned against considering cases of hysteria as malingerers and said that the mental factors producing hysteria needed careful study He declared that mental factors were often even more important than the physical conditions in connection with accidents He added

'Many suits for damage following accident are based upon occurrences of purely functional nervous affections To quote Sir John Colie, 'It is unfortunately the experience of most physicians that nervous people, who are given to self-examination, unconsciously foster subjective sensations which their stronger and better balanced neighbors would ignore The idea of illness or a possible injury and its consequences obsess them Their pains are real, but often psychic'

"When a man after severe shock or fright, which has produced no serious physical injury, complains of many subjective sensations it is not easy to believe, and often hard of proof, that the sufferer is not often an imposter who is pretending disease and exaggerating trifles for gain Often, however, the symptoms though indefinite and difficult to prove are to some extent beyond the man's control and do not necessarily disappear after the suit has been ended when motives for deceit no longer exist

"Many of the neuroses we see in civil life might be called litigation neuroses, the accident is often only the peg on which the neurosis is hung It is of course fitting that persons injured through the negligence of another should be properly compensated for their disability It is, however, natural that the temptation to bring spurious or exaggerated claims is great Nervous disorders following accident are accompanied by many difficulties both in and out of court Each man has, if he be dishonest, his price However, on the other hand, if honest, a man has his saturation point of trauma A succession of injuries may break down his morale and give rise in him to fixed fear trends, which put an end to his earning capacity, sometimes, and always reduce his usefulness

"Much may be learned of nervous instability in general from that occurring in soldiers in war After 1916 much confusion arose from the common acceptance of the words 'shell shock' to cover all cases of nervous instability occurring in the course of war Und mixed cases of amnesia, a nightmare, mutism, functional blindness, tremors, palsies and anxiety states, occurring not only under fighting strain but also in individuals who, failing in self-confidence, suffered thoughts and apprehensions while still awaiting transportation over seas

"The most important fact in war neuroses and, in my opinion, this applies also to industrial life, is that almost never were generalized psychoneuroses seen in soldiers suffering also from physical wounds of any consequence or degree. After shock or strain the degree of emotional destabilization varied inversely as the amount of gross physical injury

"On the other hand, minor injuries sustained in danger under great emotional and physical tension may become physically elaborated without any conscious desire to malinger

"It is not surprising that the claim agents or the lawyers for a company, whose medical knowledge must at least be superficial and who so constantly are witnesses of attempted frauds, should be skeptical as to the justice of claims which are oftentimes based upon symptoms the existence of which cannot be definitely proved Even physicians without special experiences in general nervous disorders do not appreciate the possible gravity of such conditions

"It is undoubtedly true that the traumatic neuroses usually begin to improve when the litigation has ended, and of all remedies financial is the most speedy and the most certain in its action An attempt has been made before Victam to show how a delusional system of ideas held for a long time and supported by what the patient regards as authority is often difficult to remove One may say that without closing litigation and satisfying the patient economically, such a delusional system of ideas cannot be cured, and occasionally even though the emotional atmosphere be made satisfactory by the above circumstance the bad tenant of a neuresthenic idea may be difficult to evict Dr Raphael Lewy, chief medical examiner for the Compensation Commission of the State of New York, even goes so far as the following 'I have stated in referring to my article on neurosis following trauma, that I cannot conceive how disease can be ended by monetary remuneration On reconsidering the matter, however, I realize that such monetary remuneration must be considered as a therapeutic agent to help the individual to disassociate his mind from his functional neurotic condition Indeed, I do not know of a single case, from my very large material, which was ever disposed of unless the individual received a monetary remuneration to his own satisfaction I may also state that in some cases the remuneration did not dispose of the case, as the individual endeavored to reopen his case after having disposed of the money which he had received'

"The hopes for recovery of health are enormously better if there be no question of litigation, and if the proper moral influences can be brought to bear on the patient immediately after the accident Under the circumstances the outlook for recovery should be very good Preceding organic disease, especially arteriosclerosis, renders the process more grave

"How does one cure a paralysis due to a false system of ideas or a loss of special sense due to suggestion? Or a fear state due to the agitation of litigation and anxious hope? The removal of objective by closing litigation is the first requisite After that we need accurate technical knowledge That is the only power that will give men trained like you and me, the power to cure symptoms due to disordered thinking and feeling It is through knowledge of the body that we doctors can acquire sufficient confidence of ourselves to cure the mind"

Dr. Walter Timme, Senior Attending Neurologist, Neurological Institute, spoke on "Endocrines and the Vegetative System"

Deficiency in blood calcium was attributed as the cause of many instances of misbehavior Discussing the symptoms of this deficiency, he said

"They usually came because of inordinate fatigability, irritability of temper and at times even of incorrigibility, non-amenability to discipline, and assaultiveness They were easily aroused to a high pitch of anger at the slightest provocation—a word, an insinuation or even a glance being sufficient to arouse intense antagonistic reaction These patients became problem cases at home, at school or in whatever environment they found themselves, because of their non-adaptability and uncompromising attitude Occasionally their behavior became so exaggerated that apparently hypomanic states developed therefrom, and several of these patients had to be confined in institutions until the symptoms were ameliorated At home, a harsh word from any member of the family, at the table for instance, would result in a plate or knife or some other utensil being thrown at the aggressor In school, a blow, a shout or a curse would be hurled at a fellow student, or even at the teacher"

Incidentally Dr Timme remarked that the speed of nervous reaction is perhaps also the basis of the wit and precocity shown by some persons He emphasized the importance of study and evaluation of the relationship between the endocrines and the vegetative nervous system, and of the research along this line

---

High pressure and high tension modern civilization literally give many people a headache, said Dr Frederick Tilney, Professor of Neurology at Columbia University, in his address on "Headache and Migraine"

Stressing the mental and nervous factors in the causation of headache—"nervous wear and tear in all walks of life"—Dr Tilney said that "the anxieties and strainings provoked by the struggle to reach what may allure but seldom satisfy bear down heavily on our vital resistance until the machine is severely overtaxed Many causes which shorten life, lessen efficiency or foster disease arise from the congestion, haste and striving of modern living, especially in our great overcrowded communities The parasitic advantages of such existence appear to be more desirable than better health or fuller contentment More intelligent living may in time prevent or weed out numerous ills which we now are compelled to bear That time seems still a long way off Meanwhile, we shall need to employ and improve such palliative equipment as we possess to combat the afflictions of body and mind" Dr Tilney discussed sixteen types of headache

"Last year I was asked to speak on 'The Aging of the Human Brain' After reviewing such material, I came to the tentative conclusion that the aged brain is more the result of disease than of time, that it is in the strict sense a symptom of extensive pathological change accumulated during the course of a greater or lesser number of years

"This year I do not hesitate to draw a thoroughly positive conclusion Headache is a symptom From the clinical standpoint it must be regarded in this light In fact, I wish at the outset to emphasize this point of view and especially to stress the importance of regarding this symptom as an indication of disease which demands the most thorough diagnostic investigation before its treatment may be approached

"Headache, in every aspect, is a challenge Many are they who, in all times, have gone out to meet it In order to gain some idea of the proportions of the attack already made upon this prevalent symptom, I had collected for me during the past summer a vast number of references on the subject of headache in medical literature The volume of effort and thought which this bibliography represents is surprising More surprising still is the fact that nearly every part of the human anatomy has been incriminated as the arch offender in headache The gamut runs from ovary to pituitary, from flat feet to eye-strain. Offending material agencies outside of the body, like war, alcohol, nicotine and every variety of food, come in for their specific reproaches as causative elements Certain extra-corporeal, immaterial factors, such as the psyche, are made to bear their special burdens in the explanation of psychogenic and psychoneurotic headache

"We are a long way from anything approaching an adequate understanding of the exact nature and mechanism of headache Nevertheless, this condition is constantly with us either as a visitant causing personal distress, or as a practical issue to be met in our patients

'In the practical management of such situations, one man's formula is as good as another's I may be privileged, therefore, to say that it is my practice in every case of this kind to make a complete diagnostic study requiring hospitalization lasting from three days to one week This study of the patient aims to cover every possible focus of disorder which the symptom headache may suggest"

Opening the second week of the Graduate Fortnight, DR ROBERT H HALSEY, Professor of Medicine at The New York Post-Graduate Medical School, discussed the influence of the emotions and psychic factors in causing certain kinds of heart disorders His subject was "The Cardiac Neuroses"

After alluding to the changes in the methods of investigating medical problems in the past 30 years and reviewing pertinent literature in the field Dr Halsey said

"In view of the demonstrated reactions of the mind to conditions of environment, used in its broadest sense, it appears justified to connect them with the disorders of the heart, which occur so frequently with the emotions as the etiological factor From work done by psychologists and psychiatrists it seems justified to point out that it is an unhappy status of the mind due to unfulfilled desires and conflicts that set the stage, or condition the onset of a cardiac disturbance, as one way of escape from unhappy situations or as an offensive in the accomplishment of a much desired objective

"Since then the emotional disturbance acts through the physiological mechanism of the sympathetic system and the structure of the heart is not damaged, if it is to be considered as a biological reaction, a working formula might be phrased as follows

"A cardiac neurosis is a disorder of the physiologic action of the heart produced by an emotional reaction of the patient without inherent, characteristic structural change

"It is the invisible, intangible and impalpable reaction of the mind, effecting disturbances of cardiac physiology, possibly by changes chemical in character, as contrasted with the known and ponderable changes of structure as effected by processes of disease, viz , inflammation, degeneration and the production of new tissue

"Experimental work has been done which suggests that certain substances acting upon the heart can produce a 'critical state' of the heart muscle under which condition it will react to stimuli in a very different way than when the critical state does not exist This conception assumes the principle that one physiological derangement must exist before another stimulus will be effective to produce the abnormal reaction Thus the patient with a neurosis of the heart must have had some psychical disturbance or conflict of sufficiently long duration to set the stage, or conditions, for an apparently unrelated event of emotional character to start an abnormal mechanism in the heart

"The new mechanism may be initiated in a heart previously undamaged or it may complicate the action of a heart already structurally damaged by disease Of itself it adds no disease process, it produces no structural change of pathology, it produces only a physiological derangement of action

"The disorder will manifest itself in phenomena of rhythm, rate or sensation as may result from the action of other etiologic agents whether endocrinous, chemical, thermal, or bacterial in origin

"Its onset may complicate the clinical picture of a heart with anatomic damage and render difficult the differentiation between the symptoms due to structure change and those of the abnormal physiology

Influence of Emotions—"Emotions may be described as the reaction of the individual to external events when interpreted by that individual's intellectual capacity and personality The type of reaction will depend upon the desires of the individual and the environmental condition affecting the struggle for satisfaction

"There are certain basic emotions which may act—combat (anger), escape (fear), repulsion (disgust), parental (tender emotion), appeal (distress), curiosity (curiosity), submission (feeling of subjection), assertion (elation), pairing (lust), social (feeling of loneliness), food seeking (appetite), acquisition (feeling of ownership), construction (feeling of creativeness), laughter (amusement)

"It is the circumstances of the environment, of the hereditary staff, of the geographical position, of the educational attainments and even of disease that often determines the failure or fulfillment of legitimate human desires Desires which may not have been formulated even in the conscious thought or words but the failure of achievement may be attended by conflicting emotions as poignant and keen as if the wish had been expressed

"The accomplishment of some desire may require building an offensive over a long period of time and then the neurosis becomes a substitute, an explanation and an asset (Casamajor)

"The definition seems to me properly to exclude from consideration effort syndrome, irritable heart, neuro-circulatory asthenia, as descriptive synonyms of a condition in which the probably hereditary deficiency is only part of a general, multiple, systemic instability—or pathologic constitutional entity

"In arriving at a diagnosis it is necessary, first

—to analyze the separate symptoms, then make a physical examination to discover the structural state and finally make an experimental test of the individual function to discover deviations, second —it is necessary to synthesize the findings into a syndrome fitting the pathologic physiology and indicating the pathogenesis

"In its broadest aspect, prognosis is the answer the patient desires and about which he questions himself and may not question the physician, for they are not always consciously or verbally expressed as follows

"If suspected of having heart disease—Have I, or have I not heart disease,' 'angina pectoris,' 'arteriosclerosis,' hardening of the arteries?'

"If he has some cardiac defect—Am I going to die, or am I going to get well or be 'cured?' Shall I be ill a short or a long time?' 'Shall I suffer pain or die suddenly?' 'Shall I be permanently crpipled?' 'Will my earning capacity be affected?' 'Shall I change or lose my job?' 'Must I assume financial debt?' 'Can I afford to be ill?'

'The replies to the patient should state the facts in such a way as to answer these questions and at the same time inspire courage, hope and assurance that all will be well

"Exclude tea, coffee, tobacco, alcohol, sexual excitement Rest, regular hours, ten hours in bed Regular meals Hydrotherapy—bath, tepid, vigorous coarse towel Prescribe exercise—diverting, graduated and increasing amount, especially for those with acceleration, palpitation, premature contractions—a safe and sure way of inspiring confidence in the patient's self Drugs for brief period only such as mild hypnotics, the bromides, or pheno-barbital. Exclude opium and digitalis They should not be administered

"As to surgery—Gordon has stated concisely No removal of tissue or organs, no artificial correction of disturbances, however accurately or skilfully they may be done will succeed in making a psycho-neurotic discard his fixed ideas, his hypochondriasis, his abulias, his fears or his obsessons' But skilful, tehnical analysis may indicate the rational therapy which will assist effective illumination to do its work

"Be sympathetic in maner of approach and relations

"It is most important how a thing is said rather than what is said and how a thing is done rather than what is done

'Gain intelligent cooperation through frankness, understanding and confidence

"Give assurance of no danger

"Do not vacillate

"Foster favorable emotions and avoid unfavorable emotional reactions

"Make favorable suggestions and avoid adverse suggestions

Build up a favorable sentiment, courage, hope"

"The Approach to the Gastro-Intestinal Neuroses" was considered by DR BURRILL B CROHN Associate Physician at the Mount Sinai Hospital He considered the subject under a number of heads such as the importance of heredity, social conflict, nerves and retired business men, effects of prohibition, tobacco, etc He said in part

Social Conflict —"In by far the greatest number of instances social conflict and dysharmony between the individual himself and his environment underlies the etiology of the neuroses Today, as in every other time in the history of the evolution of man, there is a conflict between the individual and the conventional concepts of the group The Social Biologic theory stresses the antagonism or lack of harmony between the ego of the man the interests of the social group known as Society

"The instincts of self-preservation and of procreation represent the two fundamental prerequisites to and of biologic life The threat to the former (self-preservation) constitutes the basis for the neuroses according to the Social Biologic School, according to the Freudian psychoanalysts, the causation of the neuroses lies essentially in disturbances of the sex-life

"The higher civilization of today, its greater complexity and the intensity of ones individualism lead to greater conflicts than ever between the individual's behavior and the mass needs of the social group The neuroses is the evidence of the instinctive desires of the individual mantagonistic relation to the purposeful moral activities of the complex social organization

"The weakening of the hold of religion, as we see it today, upon the mind and conduct of the person has relaxed the moral conventions and has liberated the individual to a greater freedom and a more deliberate choice of personal conduct under difficult conditions To the strongminded this is an advantage, strengthening his self-confidence and his will, to the weaker, robbed of the protection and the authoritative guidance of the church this is at times almost a misfortune Unable to turn for guidance to a supernatural Deity he is forced to rely upon himself, and in his confusions and doubts his less capable mentality wavers and vacillates, often engendering mental conflicts which may eventuate in a neurosis

"Simple domestic relations, even under the most favorable of conditions may very often provide a nucleus of discord and dissonance upon which many of the neuroses are based

"The selfishness and heedlessness of adult children are commonly, in my experience the bases of gastric and intestinal neuroses Conversely, the parents often originate problems of greater com-

plexity, particularly when the parents are advanced in years and the children are married and have their own problems Irascible, demanding, and autocratic abuse of parenthood creates as many problems as do the issues which arise over the training of younger and dependent children

Treatment Hard and Complex "In general the outlook for the neurotic is poor, occasionally the physician can by his authority dispel fear and reawaken self-confidence and so by suggestion bring a case to a happy outcome But as a generalization, the vast number of neurotic patients who, ceaselessly and obstinately hopeful, make the endless round of physicians with reputations, attest the failure of our profession successfully to cope with their problems

"Social biological problems are never simple, they involve not only the patient but the numerous adjacent individuals of the family unit, and business and economic conditions both personal and sociological We can often control the patient, build up his mental reserves and strengthen his ego, but can we ever or even sometimes change the problem as it affects the other actors in the drama? Who is Solomon who will judge the right from the wrong in personal and domestic strifes, particularly when only the plaintiff is being heard and then only with a self-prejudiced leaning? But even presuming upon a decision and a line of advice and conduct for a patient, can the physician engender love where there is none, attention and solicitude from a wandering mate, eliminate jealousy by an authoritative flourish or bring prosperity and restored business acumen by an ex-cathedra command?

"In the simple cases, particularly the anxiety neuroses, the sympathetic understanding physician is of the greatest help in restoring the patient's confidence in himself, and reassuring the anxious one that organic disease is absent In the complicated cases the assistance of trained neuropsychologists is necessary

"The Role of Psychoanalysis For the more complicated cases, particularly the hysterias, the psychoanalytic method of Freud and his followers offers the most rational and most promising school of therapy This method too has its obvious drawbacks It is very time-consuming, in complicated cases requiring six months to two years for a successful analysis, it is therefore expensive, usually beyond the means of all but the most fortunate It is impracticable in hospital and ward work, both because of the lack of privacy and facilities and of the time on the part of the neurologist to handle the vast mass of the material It lays undue stress on the sexual element in personal life, rarely failing to find some sexual dysharmony in every patient's problem and often unable to look beyond such a limited viewpoint to the adjacent broader biological and sociological problems But in due justice to psychoanalysis we must say that it has offered us the most logical and most scientific approach to the solution of the question of dealing with psychoneurotic persons

'As a practical problem, however, because of the mass of the material and the limited number of accessible specially trained neurologists, it becomes necessary for each and every one of us to become his own analyst

"Quackery and Cults The failure of the profession properly to educate itself in this problem and successfully to cope with it has led to the rise of cults and quackery throughout our civilized world Old as time and medical history, the holy medicine man and the quack imposter of the cultists of today have taken advantage of the situation and have exploited themselves and their faiths as magical, spiritual or religious healers Whether by one method or another they practice by means of suggestion and suggestion only, whether by teeth of serpents, magic fire, Perkins tractors or Mary Baker Eddy's *Monitor,* their methods are all based upon suggestion Were that all, there would be less criticism—but it is their inability to make a scientific differential diagnosis of diseased conditions that makes a danger to the body social They are successful only in proportion as they are led by men or women of unusual ability in understanding human nature and human equations

---

The subject of "Post-operative Emotional Disorders, Their Prevention and Management," was discussed by Dr Robert B McGraw, Professor of Clinical Psychiatry at Columbia University Some abstracts from his paper follow

"It might be truthfully said that there is practically no such diagnosis admissible as post-operative psychosis or post-operative neurosis It might, on the other hand, be equally truthfully stated that any kind of emotional or mental disorder might apparently be caused by an operation

"The individual plus a special situation leads to a reaction—in the present instance, a maladaptation, which we are pleased to call a neurosis or psychosis (We are considering at the present time situations which include an operation)

"Now, ideally, we should consider carefully *first* the individual, later, the situation We should inquire what is his stock? How have his forbears and immediate family reacted to difficulties in their lives? (Both emotional and physical difficulties should be considered) *What is his physical type?* What is his previous physical history? What is his general intellectual level? What are his previous experiences? Has he ever been in a hospital before? Has he ever been operated on before? What is his station in life? What are his capacities for reacting to novel situations?

"What are his instinctive reactions? For ex-

ample, is he fearful? Is he friendly? Is he strongly attached to his family? Is he subject to mood swings? Is he persistent? Is he vindictive? Is he stable? Is he impulsive?

"In the case of a patient not acutely ill or when it is proposed to operate for a chronic disorder or to explore, it is, I feel, very strongly the duty of the attending physician to make careful inquiry and form an honest estimation of the patient's probable adaptability before the operation

"Cases are sometimes even now seen where an operation has been done on a frankly psychotic patient to relieve a symptom which on a little questioning would have been shown to be delusional I am not unaware that surgeons are deliberately deceived by relatives sometimes"

Dr. Marcus A Rothschild, Associate Physician at Mount Sinai Hospital, discussed the subject of "Neurocirculatory Asthenia" He said in part

"The term neurocirculatory asthenia was coined during the World War to designate a symptom complex which had previously been well known and called 'Irritable Heart,' 'Disordered Action of the Heart,' 'Vaso-Motor Neurosis,' 'Functional Cardiovascular Disorder,' and 'Effort Syndrome' Most of the earlier references are to be found in American literature

"Neurocirculatory asthenia is not a clinical entity, but a syndrome with many etiological and predisposing factors It is not a disease of the heart

"The name is purely descriptive of the major symptoms which are referable to the nervous and circulatory symptoms and associated with an increased susceptibility to fatigue.

"The general wear and tear of life or great national crises may make active a latent neurocirculatory asthenia.

Symptoms and Signs "It is because of (1) breathlessness, (2) palpitation, and (3) exhaustion, that most cases appear for examination, and for these very same reasons that these patients are especially concerned about their hearts

"Notwithstanding the fact that for almost a half a century, the condition of 'irritable heart,' or N C A was known, up to the beginning of the World's War as Conner puts it, 'it is doubtful if one physician in a thousand had ever ventured to make the diagnosis'

Conclusions about the Disorder "Neurocirculatory asthenia is not a clinical entity, but a symptom complex due to many causes

"It is not a disease of the heart. Cardiac murmurs are present in over 80 per cent of the cases Heart murmurs do not mean heart disease Breathlessness and pain in the 'heart,' left chest, rarely mean heart disease in young adults In fact, the patients with organic heart disease rarely complain of these symptoms The great lesson to be learned is that most systolic murmurs, so-called 'leaky valves,' 'leaking heart,' and 'murmuring heart,' do not mean heart disease, and the early recognition and proper handling of these patients will restore the vast majority of them to usefulness and health

---

Dr. Louis Casamajor, Professor of Neurology, Columbia University, spoke on the subject of "The Psychoneuroses" and said

"If there are psychoneuroses, they are part of the penalty and price man has paid for the restriction of freedom of personal action which civilization has brought

"He termed "Anxiety Neurosis" the most common of the neuroses He also mentioned "Engagement Neuroses" which he explained sometimes arise 'where courtship is prolonged and violent'

"The treatment of the psychoneuroses comprises a good part of the modern practice of medicine," said Dr Casamajor "There can be no accurate estimation of the prevalence of these conditions for if one should define them rather broadly, a very large majority of all adult civilized humans would well come under the classification Psychoneurotic states of some degree are so general that one often feels inclined to dispense with the term as descriptive of a condition and to substitute a term indicating a state of mind Were such a term to be found we could then speak of psychoneurotic thinking rather than a psychoneurotic state"

Dr William A White, Superintendent of St Elizabeth's Hospital, Washington, D C, presented a paper on "Psychotherapy," what it is, its different forms and methods, and how it works

"If we bear these factors in mind we will realize that psychotherapy has a value but must be only applied as a major procedure in a certain restricted territory, particularly in that territory in which the symptoms are of psychogenic origin, that this territory is both smaller than had been supposed and larger than is generally thought, that many of the agents that are used for other than psychotherapeutic reasons do have psychological influences, and that there are many mental conditions associated with other conditions which are fundamentally not accessible to psychotherapy which nevertheless can be improved by psychotherapeutic means It would appear from this, therefore, that there is a certain fairly well-defined group, at least theoretically well-defined, in which psychotherapy is the method of election There are certain other groups equally well defined in

which surgery is the method of election, etc This is all relatively simple It is not always so, however, in reality If you have followed the development in psychological thought in recent years you will realize that the distinctions that have grown up between mind and body are being gradually dissolved Not that we know anything more about the mind as such and intrinsically than we ever did, but that for practical purposes of therapy, for example, the distinction has been found in recent years to have less and less value And so, to use a biological term, we have come to think of the organism as a whole and to deal with it therapeutically from that point of view

"The two outstanding present-day problems in psychotherapy revolve about the methods of suggestion, on the one hand, and psychoanalysis on the other" He pointed out that "to a certain extent we all of us remain children throughout our lives or at least we retain the possibility of childhood reactions When we are sick and necessarily depend on others, it is then that, like children, we are called upon to accept uncritically the assurances of those others that everything will come out all right, just as we used at one time to run to our mothers and get that assurance when we were in trouble

"And so the defect of various methods of suggestive therapeutics has always been that the method was dependent upon the personality of the therapist and that it involved a relation on the part of the patient of dependence, and further and more important and significant yet, that really nothing happened so far as the patient was concerned except the temporary disappearance of the symptoms The possibility of their return was always present, either in the form in which they had appeared or in some other form So that suggestion merely became a reassurance of the patient for the time being, who at the next stressful moment in his life would again need reassurance and who might be so constituted that he felt the need of reassurance so continuously that he became a regular dependent upon the physician for his daily living Everyone who has used suggestive therapy, particularly such methods as hypnotism, has seen these phenomena over and over again and has felt only too frequently that he was writing in the sand

"The more recent developments, particularly psychoanalysis in its various forms, have approached the problem quite differently In this field there has been a continuous effort to understand the meaning of the symptoms, to understand the structure of the symptoms, and roughly speaking as a result of that understanding to develop a technique that would tear down the symptoms, destroy them, as it were, so that they never again could appear in evidence, and then having destroyed the symptoms assist either passively or actively in the building up of a new structure in their place Such a method of therapy has necessarily involved an entirely new approach to the problems of the mind and to its understanding, and this new approach has been quite analogous in its historical unfoldings to the approach to an understanding of our physical body The understanding of the mind and of its various symptoms as they may develop under untoward circumstances is dependent upon an understanding of its development both in the individual and in the race, and so this study of psychology has been elaborated in these directions as a part of the equipment of the psychotherapist, and he now undertakes to deal with psychotherapeutic problems upon the basis of what he knows about the structure and functions of the mind and about the historical stages in its development, both individual and racial

"No matter whether we may or may not agree with any specific conclusions that any particular psychoanalyst may have reached as a result of his studies, there can be no shadow of a doubt that this effort to understand the structure and functions of the mind in quite the same way as we understand the structure and functions of the body, not only their present status but their meaning expressed in terms of origin and history, is the only method by which we can hope to advance in this infinitely intricate and complicated territory

"If we are to lay aside our distinctions of mind and body or at least to consider such distinctions as of no practical importance then it must follow of necessity that, in an organism functioning as a whole, any disease process, no matter what, must have both mental and bodily components even though in any particular case one or the other may be so prominently in the foreground as to all but shut out from view completely the other This being so, it is logical to assume that psychotherapy even in admittedly and obviously organic diseases may be of value"

DIPHTHERIA PREVENTION IN NIAGARA FALLS*

By EDWARD E GILLICK, M D, NIAGARA FALLS, N Y

I PROPOSE to confine my remarks during the time that I have as far as possible to what occurred in Niagara Falls in the spring of 1928 in reference to the prevention of diphtheria I presume the scientific discussion of the question of active immunization against diphtheria will be thoroughly covered in other papers and I believe it was the intention of Dr William L Munson, who arranged the program, to have me tell you about our experience at the Falls I am always delighted to tell of our experience over there in reference to this matter, because it was an exceedingly pleasant experience from start to finish The institution of the work of immunization and the results were very satisfactory to every one concerned

Niagara Falls, a city of approximately 75 000 population, has about 21,000 children under 14 years of age We have a City Manager form of government, with a Mayor and Council, and I believe I am justified in saying that our city government and the people of Niagara Falls are intensely interested in matters concerning public health

Four years ago the Health Department began the work of encouraging the immunization of children against diphtheria by toxin-antitoxin During the year 1924, 2,000 school children were immunized, during 1925 none were treated except a few in the private practice of some of the physicians, in 1926 there were 2552, and in 1927 4200 children were treated This group of 8752 was practically all school children, and by the end of 1927 we found that only about two per cent of the pre-school children of the city had been immunized and approximately 35 per cent of the school children

It appeared from our record of the first three years of this time that we were really accomplishing something because our cases and deaths from diphtheria had decreased during 1925 and 1926 as shown on the chart However, during the year 1927 the number of cases and deaths materially increased again and it appeared that we had arrived at another cycle in diphtheria history where an increase was bound to occur In other words, it appeared in the latter part of 1927 as though a diphtheria epidemic were imminent and then I was convinced that although we had done considerable immunization work we had not immunized the group of children in the city which it was absolutely necessary to immunize in order to limit the ravages of the disease I was laboring during those three previous years under practically the same misunderstanding of the situation that the other health officers were I had believed before that if a large percentage of the school children were immunized the incidence of the disease would be materially decreased I am quite satisfied now that that was a mistaken notion and that it is necessary to secure the immunization of a large percentage of pre-school children rather than school children

During the latter months of 1927 the number of cases and deaths steadily increased and I felt it necessary, if we were going to accomplish the desired result, to take measures that promised to be more effective in the way of inducing pre-school children to get immunized than we had used in the past and I propose to go into some detail in explanation of what we actually did

I felt that if the mass consciousness of the community could be properly aroused in reference to the diphtheria situation in the city a favorable response was bound to follow and all our effort there was confined to the one subject of stimulating active, general public interest in the matter

In December, 1927, at a meeting of the medical fraternity in this city I asked for the cooperation of the doctors in a plan which had in mind the conduct of the free toxin-antitoxin clinics, wide publicity, etc They passed a resolution that evening endorsing a plan which I proposed to submit later

During the same month I also called a meeting of the school physicians, nurses and our superintendent of schools for a discussion of the proposition A little later I called a meeting of the Catholic priests who have charge of the parochial schools in the city and the situation was explained in detail to them I tried at that meeting, also, to make the priests, as I had the other school authorities, feel that they had a real responsibility and that their assistance would be very material

Early in February I presented the matter to the Industrial Relations Group of the Chamber of Commerce, stating at that meeting that children were dying in the city from diphtheria too often and that the only remedy was a campaign which would procure the immunization of a large percentage of our younger children This committee passed a resolution directing the secretary to appear before the directors of the Chamber of Commerce and ask the cooperation of that body in a proposed pre-school anti-diphtheria campaign as suggested by the Health Officer, and the secretary reported at the next meeting that the directors approved the plan to assist in an anti-diphtheria drive and to do everything possible to make it successful

I then called another special meeting of the

* Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N Y, June 6 1929

physicians of this city for the purpose of discussion of the details of the plan which I suggested I felt that we needed, if possible, the cooperation of the physicians of the city The plan suggested included a general plan of advertising through all available sources which we considered might hold hope of success newspaper articles and articles in factory leaflets, meetings with the various social organizations in the city, foremen's meetings, announcements by the clergymen at their Sunday services, house-to-house canvass by nurses or others competent to explain the matter intelligently, picture theatre demonstrations, distributing posters in business places—particularly in sections of the city where the disease was more prevalent, in short an advertising plan as extensive as possible, to be conducted more or less similar to campaigns we have had in the city to sell Liberty Bonds or to raise money for the Community Chest This campaign was to be conducted for about three weeks—intensively during the last week

The doctors at our meeting were informed that their suggestions regarding the conduct of the work would be followed in all respects, that I proposed the physicians be paid a reasonable fee for their services and the physicians were asked to set that fee The number, dates and places where the clinics were to be held was decided upon at the conference with the doctors and with the school authorities

I asked the City Council to call a citizens mass meeting to consider the proposition The Mayor promptly called the meeting and he and a majority of the Council attended Our District State Health Officer and the District State Health Officer from Syracuse were present and addressed the meeting Other addresses were made and the Acting Mayor at the close announced the appointment of a large general committee to assist in the conduct of the work and also committees on the administration of toxin-antitoxin, nursing service, clinic arrangements, publicity, speakers, home canvass, industries, schools and transportation The committee on the administration of toxin-antitoxin consisted wholly of medical men

The proposition was presented to the editor of our local daily paper and for about ten days before the date set for the first clinic daily articles concerning the plans of the campaign, progress of the work, efficiency of the toxin-antitoxin treatment and history of the existing cases of diphtheria at that time were carried We arranged for the showing of films, which we obtained from the State Dept of Health and the Metropolitan Life Insurance Company in the local theatres A number of physicians in the city wrote articles, which were published in the paper Nearly all of the large industrial plants arranged for meetings at the noon hour or some other convenient time, which were addressed by physicians or others familiar with the work Addresses were also delivered before nearly all of our social clubs, and house-to-house canvass was conducted by nurses, particularly in sections of the city where the disease was prevalent This canvass covered approximately a third of the city Circular letters were sent to the clergymen, and a large quantity of current literature (pamphlet form) as arranged by the Metropolitan Life Insurance Co, John Hancock Life Insurance Co, American Association for Medical Progress, State Charities Aid Association, and State Dept of Health was distributed in the factories All factory employees received literature bearing on the subject

Before the campaign had progressed very far *nearly every person in town apparently* became deeply interested in the matter The factory managers and welfare men arranged so that every employee was interviewed and we had distributed in the factories consent slips in duplicate form, each parent who had children being asked to sign them Transportation was arranged so that if the parents could not bring the children to the clinic a car would call for them This transportation was practically all gratuitous

The secretary of the Chamber of Commerce acted as chairman of the publicity committee and all publicity in the newspapers was very carefully planned and carried out under his supervision A meeting of the school teachers of the city was called and the subject presented to them and the whole Department of Education became intensively interested in our plan to eliminate diphtheria as soon as possible and their active personal cooperation to a large extent was responsible for the success of the matter

After the campaign got under way the doctors of the city gave us very valuable assistance We were constantly receiving reports from the physicians showing their hearty approval of the plan of the work A number of physicians called the Health Office at the time the campaign was conducted offering their services in any way that those services would be of assistance During the last week of the campaign I failed to hear a word of criticism coming from any physician in the city

The clinics were conducted at seven convenient locations five school buildings, one in a factory and one in the Town Hall A team including a doctor and two nurses was assigned to each of those respective places and they were assisted by the teachers, and police and firemen were detailed to assist in keeping order at the clinics Girl and boy scouts also aided materially in this matter

The first clinic was held on Saturday, March

17, and then the two following Saturdays Clinics at the City Hall followed for the benefit of those children who were not able to start with the others at the beginning

Of the 21,000 children in the city 9,000 as shown on the chart had been previously immunized against diphtheria Of those 21,000 1200 were under nine months of age Adding the 9000 and 1200 gives about 10,200 and deducting that from 21,000 (the total number of children) we have the sum of 10,800, approximately, children in this city over nine months of age and under 14 years who had not been immunized against diphtheria and of this number 6550 were immunized during the campaign, i e during our campaign we immunized approximately 60 per cent of the non-immune children in the city who were over nine months of age and of this 6550 children treated 2947 were under five years of age

The percentage of immune pre-school children was raised from 2 per cent to 48½ per cent and the percentage of immune school children was raised from 35 per cent to 72 per cent in the campaign

The results of the campaign were very evident within a short time as shown on the chart The deaths from the disease immediately stopped and the cases diminished each month I do not believe that the clinic of itself prevented deaths from diphtheria in April, May and June, but I believe it did arouse the people to the danger of the disease and believe that after the clinic the physicians were called earlier in the cases that developed and the lives of the children were saved as a result of procuring early medical attention

In reference to the attitude of the medical profession regarding this work I have nothing but the highest regard and praise for the local medical fraternity for their interest during our campaign and I think that fact is appreciated by every one concerned Still, I feel justified in saying that the attitude of the medical fraternity as a whole up to date has been extremely indifferent and disinterested Here we have a method at our disposal for the prevention of diphtheria (perhaps not surpassed in importance by any other discoveries in the field of preventive medicine during the present century) that is safe and easy of administration, with practically none of the objectionable features which ordinarily go along with work of this nature and we find the individual physician more or less disinterested I concede it is very true that the Medical Society of the State of New York and our County Societies have shown a very commendable interest in the matter and the attitude of the individual physician is improving but they are not doing as much as the situation deserves

I believe that when a case of diphtheria occurs in a home the parents may be charged with ignorance or neglect in not having had that child protected against the disease. Believe that the next measure of censure naturally falls on the family physician and do not see any reason why we cannot charge him also with ignorance or indifference in the matter

The whole problem could be solved to a large extent if every physician would feel keenly the moral obligation which he should have towards his patients and towards the community at large Believe that it would be exceptional when a parent would refuse to have a child protected against diphtheria if they were advised to have it done by the family physician, and when the time comes that the family physician on entering a home will specifically call the attention of the parents to their duty in this matter and insist as far as he can that this immunization work be done, the extensive propaganda that is required and is carried on now by official and unofficial oganizations, newspapers and magazines, etc will be unnecessary

If it is unethical for a physician at this time to recommend to his patients that they immunize their children against diphtheria by toxin-antitoxin, then our code of ethics should be rewritten Believe that the members of the medical profession in not individually interesting themselves more in this work are missing an excellent chance to increase their prestige and general good standing with the public by not taking advantage of this opportunity at this time and if there are groups of physicians in any community in this State who are actively opposing the immunization of children against diphtheria or who refuse to compromise with the health authorities or any other organization in the matter of fees, methods of procedure or other considerations in connection with the work, they are presenting the strongest argument imaginable in favor of State medicine I do not believe that the public will forever countenance that attitude in a matter as serious as this is The doctors must take an active interest in this work and appreciate fully their responsibility to their patients and the public generally or be forced out by public demand and the work taken over by other agencies Such a result would be extremely deplorable and I trust, having in mind the very enviable record in the way of self-sacrifice, unselfishness and loyalty to the highest ideals which is characteristic of our profession since time immemorial, that such a condition will not develop

In view of these facts I feel perfectly satisfied that the individual doctors comprising our profession will eventually do their part in educating the public in this important matter of health protection which is under discussion

this morning The only criticism I have of our effort to date is that we seem inexcusably slow in arriving at a proper appreciation of the importance of immunizing children against diphtheria The method employed for the prevention of this disease was thoroughly tested and proven a number of years ago, many years too long it would seem to educate the medical profession As a matter of fact it seems as difficult to interest the doctors individually in this important work as it does the lay public and this, of course, should not be the case in view of the training, education and opportunity for reading which physicians possess

THE WILLIAM BEAUMONT MEMORIAL

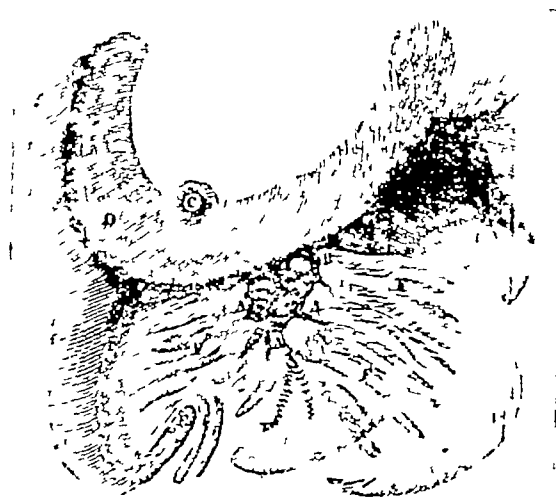
By FRANK OVERTON, M D, PATCHOGUE, N Y

Doctor William Beaumont has the distinction of being the most widely known research scientist in the United States, for his experiments and observations on the process of digestion, conducted on Alexis St Martin, have been quoted in every public school physiology and hygiene in the country His life work was brought prominently before the physicians of New York State last summer, on August 24, when a tablet to his memory was dedicated in Plattsburgh on the Margaret Street wall of the First National Bank, the site of Dr Beaumont's store and office, in the earlier years of his practice The tablet reads

William Beaumont, M D
America's Pioneer Physiologist

Born Lebanon, Conn 1785—Died St Louis, Mo, 1853
His Scientific Researches in Gastric Digestion Were Fundamental
Brevetted Surgeon's Mate 1812
In Battle of Plattsburgh 1814
Here Opened Office and Drug Store June 1815
Published His "Physiology of Digestion"
At Plattsburgh in 1833

Dr Beaumont's studies on St Martin were recorded in a book entitled "Experiments and Observations on the Gastric Juice and the Physiology of Digestion," by William Beaumont, M D, Surgeon in the U S Army Plattsburgh Printed by F P Allen, 1833"



This is a book of 280 pages and is written in a clear, interesting style It is dedicated to Joseph Lovell, M D, Surgeon General of the U S Army, whose encouragement led Dr Beaumont to conduct the experiments Its introduction of 29 pages describes the gun-shot accident by which a fistula was made into the stomach just below the left breast The book contains three engravings of the wound, one of which is reproduced with this article

The second part of the book contains 90 pages which constitute a dissertation on digestion, divided into the following sections

1 Aliment
2 *Hunger and Thirst*
3 Satisfaction and Satiety
4 Mastication, Insalivation and Deglutition
5 Digestion by the Gastric Juice
6 Appearance of the Villous Coat and of the Motions of the Stomach
7 Chymification and Uses of the Bile and Pancreatic Juice

These descriptions are marvelously modern in their style and truthfulness, and, with the exception of their chemistry, could well be used as a modern text-book on the process of digestion

The third part of the book consists of four series of observations made on St Martin The patient had been wounded on June 6, 1822, at a trading post near Ft Mackinac, Mich, where Dr Beaumont was stationed The Doctor had brought him to the Fort and nursed him back to health, and in May 1825 engaged him as his ser-

Woodcut from Dr Beaumont's book, showing the location and appearance of the wound in the side of Alexis St Martin

vant on condition that the doctor be allowed to make studies on the stomach Dr Beaumont went to Plattsburgh in May, 1825, taking St Martin with him The book records a series of four experiments on foods in the stomach, and in bottles, conducted between August 1st and August 7th These first experiments were crude and consisted merely in inserting food into the stomach and into bottles and observing the manner in which it was dissolved. St Martin was evidently restless for he soon returned to Canada and engaged in the hard labor of a voyageur, but in 1829 Dr Beaumont again engaged him and employed him at Fort Crawford on the Upper Mississippi River where the Doctor had been ordered for military service In the second series eight experiments conducted between December 1, 1829 and March 18, 1830, were on the temperature of the stomach Experiments 9 to 23 were on the secretion of gastric juice and were concluded on March 16, 1830 Experiments 24 to 46 were on digestion, both within the stomach and in bottles, and were concluded on April 9, 1830 Experiments 47 to 56 recorded his observations on the bile and pancreatic juice of oxen added to gastric juice

St. Martin returned to Canada in the Spring of 1831, but in November 1832 he again entered the employ of Dr Beaumont, who was then stationed at Plattsburgh

The third series of experiments numbered 116, most of which were performed in Washington, where Dr Beaumont took his patient in order that he might have the benefit of the facilities of the office of the Surgeon General of the Army

A fourth series of experiments were recorded as addenda to the three already described, and consisted of much more elaborate observations than those of the other series In fact, the experiments and observations extending over a period of nearly eight years show an increasing complexity as Dr Beaumont's grasp of the subject broadened

Physicians will be interested in the following description of the method of extracting the gastric juice, described on page 21 of the book

"*Mode of extracting the Gastric Juice*—The usual method of extracting the gastric juice, for experiment, is by placing the subject on his right side, depressing the valve within the aperture, introducing a gum-elastic tube, of the size of a large quill, five or six inches into the stomach, and then turning him on the left side, until the orifice becomes dependent In health, and when free from food, the stomach is *usually* entirely empty, and contracted upon itself On introducing the tube, the fluid soon begins to flow, first by drops, then in an interrupted, and sometimes in a short continuous stream Moving the tube about, up and down, or backwards and forwards, increases the discharge The quantity of fluid ordinarily obtained is from four drachms to one and a half or two ounces, varying with the circumstances and condition of the stomach Its extraction is generally attended by that peculiar sensation at the pit of the stomach, termed sinking, with some degree of faintness, which renders it necessary to stop the operation The usual time of extracting the juice is early in the morning, before he has eaten, when the stomach is empty and clean.

"On laying him horizontally on his back, pressing the hand upon the hepatic region, agitating a little, and at the same time turning him on the left side, bright yellow bile appears to flow freely through the pylorus, and passes out through the tube Sometimes it is found mixed with the gastric juice, without this operation This is, however, seldom the case, unless it has been excited by some other cause

"The chymous fluids are easily taken out by depressing the valve within the aperture, laying the hand over the lower part of the stomach, shaking a little, and pressing upwards In this manner, any quantity necessary for examination and experiment can be obtained"

Dr William Beaumont was born in Lebanon, Conn., in the year, 1785 He apparently studied medicine under preceptors only His license to practice medicine was issued to him by the Third Medical Society of Vermont, on June 2, 1812 He soon entered the Army and did valiant service at the Naval battle of Lake Champlain. Most of his time was spent in the Army at various posts, particularly at Plattsburgh and Fort Mackinac, until the year 1839, when Dr Lovell was succeeded as Surgeon General by one who failed to discern the importance of the experiments which Dr Beaumont was carrying on, and ordered the experimenter to Florida Dr Beaumont thereupon resigned from the Army and engaged in the practice of medicine in St. Louis, where he was eminently successful He died in St Louis on April 25, 1853, from the result of an accident, and is buried in Belle Fontaine Cemetery there

CHANGES IN MEDICAL ECONOMICS DURING THE PAST TWENTY YEARS

By W WARREN BRITT, M D, TONAWANDA, N Y

Abstract of paper read before the Eighth District Branch of the Medical Society of the State of New York, at Buffalo, October 3, 1929

THE past two decades have witnessed the most profound economic changes in medical history Intense individuality and competition are giving way to cooperation to such an extent that legislators no longer seek to destroy business combinations but they study to coordinate great organizations and subject them to supervision and control

Medical economics, during the past two decades, have been influenced by these same general conditions The development of the Workmen's Compensation Laws has occurred since 1910 The adaptation of the medical profession to these laws has been accompanied by much grief Young men graduating in medicine today should be given the benefit of past experiences so that they may go out with a knowledge that will assist them to cope with the changed conditions

One outstanding condition which has followed the enactment of the Workmen's Compensation Laws has been the development of a new type of industrial medical care This is illustrated by the report of the National Industrial Conference Board, as published in its Service Letter of July 5, 1929, as follows

"From a first-aid compartment or room to a fully equipped hospital providing physiotherapy treatments, laboratory tests, *x*-rays, and dental and optical service is not only a long step but a step which many employers of labor on a large scale have taken in a short space of time Notable progress has been made in many branches of industrial relations work in the past twenty years, but the advance of the medical care of employees is outstanding Industrial medicine has become an increasingly significant branch of the medical profession, and its accomplishments appear destined to hold a high place among the factors influencing American Industrial efficiency"

The article goes on to show the development of first aid relief as is illustrated by a large coal mining company which began by treating its injured workmen, and which has added new features from time to time until its medical work now includes prevention, physical examinations, and the promotion of healthful living conditions

The advantages of an organized comprehensive medical program are too obvious to require attention Two, however, may bear emphasis

1 There is the community advantage from an industrial medical service, especially when emphasis is placed upon preventive measures

2 Another advantage which will come in the future is that of old age security The Legislature of New York State has appointed a commission on this subject A report recently made by a New York employment bureau was that only 200 out of 5800 unemployed workmen between the ages of 40 and 55, who were registered with it, were able to get work during 18 months of effort The principal reason for the failure of so many was that they were too old Employers did not want them Formerly the ordinary man went on working until he was 70 years old Then there was a place for him in industry, but not now Medical assistance has lengthened life for him, but industry has shortened the years of his working life

There are two plans for the solution of the problem of old age care One is state insurance, the other is industrial pension

An article recently published in the United State Bureau of Labor Statistics presents the results of an investigation into the effectiveness of old age pension laws now in operation in the United States Six states—Colorado, Kentucky, Maryland, Montana, Nevada and Wisconsin, had more or less standard old age pension laws in effect at the beginning of this year All of these laws were optional in character, merely permitting the counties to elect to pay pensions if they so desired It was found that less than one-fifth had availed themselves of the opportunity to inaugurate an old age pension plan In these 52 counties the average payment per pensioner was $17 37 per month, or $208 44 a year This represents the amount required in addition to existing resources of the individual to bring the income of the pensioners up to $1 per day A pensioner's annual income cannot exceed $365 per year

In contrast, industrial pensions appear to advantage In a comprehensive study recently conducted by Industrial Relations Councillors, Inc, 466 instances of formal pension plans adopted by business enterprises were found Detailed information from 194 of these companies showed 2,500,000 employees covered by the pension plan, with 46,000 pensioners receiving a total of $27,200,000 a year in pension payments, or a yearly average per pensioner of about $590 00 On the basis of these figures the Industrial Relations Councillors, Inc, estimated that probably 80,000 pensioners are receiving annually approximately 50 million dollars from business concerns, and that more than 4 million workers are covered by industrial old age pension plans Industrial pensions apply to a comparatively small proportion of the population They do not provide the blanket average that apparently is a feature of the state pension laws It is customary for industrial organizations to stipulate a certain service requirement that must be fulfilled in order that an employee may qualify for a pension at the specified age This limits the benefit of pension

to a small proportion of the population, since statistics show that not more than 10 per cent of employees remain with one company for 20 years or over State pension laws usually provide that to be eligible for a pension, a pensioner must have been a citizen in the state for the preceding 15 years Consequently, state pensions are not so inclusive as might at first appear

From the social standpoint, therefore, the weak spot in industrial pensions is their application to a comparatively small proportion of the working population. What appears to be needed, however impractical it may appear at the moment, is some system of transferable credit for service, whereby at his retirement a worker may become eligible to a pension earned by service in perhaps several establishments An approach to such a system is evident in certain contributory plans underwritten by certain insurance companies

A very small proportion of employers of labor are now providing pensions, and any reciprocal plan is dependent upon a very general adherence to the pension principle It is difficult to conceive of any such widespread adoption of pension plans without some form of compulsion It will be with great interest that we will watch for the report of our present New York Commissioner on Old Age Security

Now what are we going to do about all this changing economic and social unrest? Is there anything the medical profession can do in the way of rendering human service?

I think there is Your House of Delegates at their last meeting designated a Committee on Periodic Health Examinations to study the health examination, to popularize it, and to conduct a campaign among both the physicians and the people of the state

The members of the Periodic Health Examination Committee feel that the health examination will save life, it will decrease suffering, it will postpone deterioration, it will increase health, happiness, and efficiency They believe that these great and desirable benefits should be gained by every man, woman and child in the entire state. They believe, further, that the leaders in the movement should be the physicians of the state, the men who know about health, who know about disease, and who by their daily service to the sick and suffering, have gained the confidence, love and admiration of the people of the state. They believe that it is these physicians who must give this message and bring these benefits as a further pledge of their devotion, energy and wisdom

This is a continuing campaign It will take years to put it over, but with diligence, service and energy the medical profession will get as near as possible to its objective—"Every man, woman and child in New York State to get the benefit of the Health Examination"

THE MEDICAL HISTORY OF PALESTINE*

By LA RUE COLEGROVE, M D, F.A.C S, ELMIRA, N Y

INASMUCH as the program you are having today is essentially scientific, I shall digress and ask you to accompany me on a short trip to the Holy Land, and see what the history of medicine there has been and what our colleagues are doing there today, a land which has had so much to do in shaping the destiny of man, and which is now very much in the public eye.

It is only recently that the United States has been officially represented there, having a Consul-General, Paul Knabenshue, in Jerusalem There are more American citizens there to-day than in any other part of the Orient Jerusalem has a strong attraction for Americans as evinced by the great number of tourists visiting there annually, and, by the important contributions made by Americans to the various religious, educational and charitable institutions established there

Very little can be found in medical literature touching the early history of medicine in the Holy Land Practically nothing could be found upon it in our libraries or in the library of the British Medical Association or in the library of the British Museum

But while browsing around in one of the bookstores in London, I came across a book entitled "A Galilee Doctor" and it proved to be the key to what I had been looking for It was, in fact, the full history of the first Englishman who went there to practice medicine He was a young physician, Dr T M Torrance, a graduate of Edinburgh University, and he went to Tiberias on the Sea of Galilee in 1884 as a Medical Missionary representing the Edinburgh Medical Society, and was the first Christian physician to walk in the footsteps of our Master round the Galilean Lake And furthermore he gave up a most promising career to do so

I know of no life more consecrated to service and to the alleviation of the suffering of mankind than was his, and which was attended by much privation and hardship The obstacles which confronted him amidst those primitive people, mostly of Jewish and Moslem faith, would have been unsurmountable to one of less courage. Racial and religious fanaticism was very strong The people were ignorant, degraded, and superstitious Christians they hated as their oppressors, and as those who had made their lives a misery

Dirt and vermin were rampant everywhere,

* Read before the Sixth District Branch of the Medical Society of the State of New York, at Cortland, N Y, September 27, 1929

Even to-day the fleas in Tiberias are known as the "king of the fleas" The people had not the slightest knowledge of sanitation and all kinds of animal and vegetable matter were allowed to lie and rot in the streets Polluted water was constantly being used with the natural result that the incidence of typhoid, typhus, dysentery, cholera, and infantile mortality was very high

Dr Torrance first applied himself to the study of the Arabic language which was the common language of the country And at the same time he had to gain the confidence of these poor, ignorant, bigoted people, and to make them feel that he was their friend and was there to help them rather than to oppress them

The Turkish Government opposed him in every way This despotic Government which had been in control of Palestine for over four centuries had no other interest in these people than to collect taxes on every conceivable thing, and to keep them in abject poverty and ignorance They naturally looked with suspicion on any one who wanted to help and raise them up

But conscientious painstaking work tells, and it was a happy day for the doctor when in 1894 just 10 years after taking up the work, the dream of his life was realized when he saw his hospital of 24 beds and 6 cots completed At the formal opening there was the Governor representing the Turkish Government, the Grand Mufti, the religious head of the Moslem, Greek Catholic Priests, and distinguished Jews, all sitting together, an assemblage no one would have thought possible a few years before

To-day the United Free Church of Scotland, which is the name of the hospital, is under the management of his son Dr H Torrance, it has some 70 beds and is an up-to-date hospital in every respect Connected with the hospital is a voluntary Dispensary which had an attendance last year of 8,653 patients This was the first and is yet the only Christian hospital in the province of Galilee to-day

Recently it was my pleasure to have met Dr Percy Wheeler of London on a steamer at Alexandria, who went to Jerusalem as a Medical Missionary in 1885 representing the English Mission Society, remaining there 25 years His story of his work there with those primitive people was very interesting

At that time there were only two or three small hospitals, several hospices, and more so-called "homes" The water supply was dependent entirely upon rain water, and a sufficient supply had to be collected during the rainy season and stored in cisterns, there being over 5,000 of them in Jerusalem alone, to bridge over the dry summer months when there was no rain One could readily see that unless proper precautions were taken in keeping these cisterns from contamination, epidemics would result Epidemics of typhoid and dysentery were frequent, and at times one-quarter of the entire population was affected

From very ancient times Jerusalem has had some sort of a sewer system, but a very inadequate one, not one house in fifty being connected to it The narrow, crooked, climbing alleys, or so-called streets, were simply cess-pools An Oriental notion of a street would appear to have been a receptacle for whatever was useless Dogs were the official street scavengers, being turned loose in the street at night for that purpose

The inhabitants then as to-day, represented every race and nationality upon the face of the earth The poverty, dirt, and privation, insufficient clothing, ill-ventilated houses, and pale anemic faces told too plainly the tale of want and misery

Jerusalem naturally should be one of the healthiest cities in the world, situated as it is in about the same latitude as Southern California, and on the sunny side of two high mountain peaks, Mt Moriah and Mt. Zion, 2,500 feet above sea-level, and on both sides are deep valleys, the Valley of Jehoshaphat on the east and the Valley of Hinnon on the west, which meet on the south just below the southern wall of the city The undulating character of the land made drainage very easy But no city in the world has been subjected to more pestilence, plague and disease On several occasions it has been nearly depopulated

Let us look upon Jerusalem as you will see it to-day under British Mandate since 1917 when the British under General Allenby drove the Turks out of Palestine, thus putting an end to their control in the Holy Land where they had ruled with a cruel hand for over four centuries

Jerusalem to-day is as clean as the average American city Notwithstanding the poverty which one sees on every side, there is practically no begging, while but a few years ago begging in Jerusalem was an art The water supply is greater than it has been at any time in its history, under Solomon or Herod They now boast of four supplies, the largest is from Solomon's Pool about 14 miles south of the city During Solomon's time he built a reservoir out of the solid rock, but it was not utilized until our Master's time when Herod brought the water to Jerusalem by way of a stone aqueduct Some of this may be seen to-day on the way to Bethlehem, six miles south of Jerusalem The British have repaired this system after it was out of use for 1,100 years As the fall is only about a foot per mile from the pool to the city other sources had to be found A very interesting source was found They utilized one built by Pontius Pilate some 1,900 years ago several miles south of the city He never brought the water to the city as he contemplated Inasmuch in its construction he used the Temple money, the Jews sent a delegation to Rome and had him removed The Turks talked about using this system for over 400 years, but within four

months after the war, General Allenby was bringing water to the city through this system Two other small sources have been utilized, but they do not solve the problem, for they do not supply two gallons per capita, and not twenty per cent of the houses are connected with the system

Great progress has been made in improving the sanitary conditions A street cleaning system has been inaugurated and all the shops or so-called stores must be whitewashed yearly A garbage system is in use and garbage cans are being used

The fly and mosquito nuisance is gradually being overcome, thus reducing the incidence of malaria and other infections

Trachoma treatment is given regularly in all public schools, and all teachers and pupils are periodically inoculated against typhoid Vaccination against smallpox is compulsory

The lepers have been segregated, hence you will not see them around the Jaffa Gate as of old, showing their fingerless hands and asking alms

Palestine no larger than the State of Vermont has an estimated population of about 800,000, which does not include the nomadic Bedouin population estimated at 105,000 It has 634 registered physicians, 104 being women, 160 pharmacists, 183 dentists, and 221 trained and licensed midwives

There are something like 31 Child Welfare Centers, 20 of which are Jewish, 7 Government, and 4 conducted for Arab children supported by voluntary contributions

Government laboratories are established throughout the country where thousands of bacteriological and chemical examinations are made, also where all their prophylactic and curative vaccines are manufactured

No city in the world is so thoroughly hospitalized as Jerusalem, 814 bed strength or 165 beds per 10,000 population.

At the last International Hospital Congress held in June of this year at Atlantic City it was stated that the white race needed from 50 to 80 beds per 10,000 population The U S stands sixth in the list with 74 5

All the Hospitals in Jerusalem and throughout Palestine except private ones draw their expenses from the country or mission establishing them The Jewish Hospitals head the list. Their great International Hadassah Association pours millions of dollars yearly into that country for their hospital support

One of the finest hospitals in Jerusalem is the Rothschild built by the Rothschild family of Paris and supported by the Hadassah Association It has a bed capacity of 125, a special building for their bacteriological, chemical, and pathological laboratories, an up-to-date x-ray institute and its own electric installation for light and therapeutical purposes Connected with it as with all the hospitals, is a dispensary and clinic Last year they had a total attendance of 124,523 patients, of whom 26,000 were new patients

The French Hospital is the largest with 150 beds It is beautiful with all modern improvements 34,000 were treated in its out-patient department last year

The Italian Hospital of 60 beds was built by the Italian Government by the balance obtained from the Boxer Indemnity above the losses sustained by Italians

English Mission Hospital of 70 beds founded in 1898 by the London Jewish Society, has had a training school for nurses since 1920 156 nurses have been trained and registered

German Hospital, one of the oldest in Jerusalem, started in 1851, is supported by the Deaconesses of Kaiserwerth, Germany Has 60 beds and is soon to be enlarged

Leper Hospital founded by the International Moravian Society, has 60 beds, and treated 67 cases during the past year

The Ophthalmic Hospital, founded and supported by the Order of St John, an English Society, lineal descendants of the Crusaders, does a tremendous amount of good 87,000 patients applied last year for the relief of some form of eye trouble Blindness is one of the common afflictions of the people of Palestine Neglect and ignorance, dirt, and the plague of crawling flies spread the germs of disease from eye to eye and the people submit to it with pathetic and irritating fatalism

The Government has established throughout Palestine numerous Ophthalmic Clinics Last year nearly one-eighth of the entire population applied for treatment for some form of eye trouble

There are several general and infectious hospitals under government control, all having outpatient departments where thousands receive free treatment.

All the Hospitals are well staffed with specialists in each department, all modern appliances, and nurses trained and registered

Notwithstanding all that medical science has done and the great improvement by the English in improving the sanitary conditions, the incidence of typhoid, typhus, dysentery, cholera, malaria, and infantile mortality is very high Last year the death rate was 28 plus per 1,000 and over 200 in children under one year of age

It is a difficult proposition to instil into these people who have lived in such primitive condition for centuries, modern methods of living Where superstition has always played such an important role, they seem actually to believe that dirt is essential to health The people within the wall have changed but little in their manner of living, their dress, customs, habits, and their little shops or stores, from their ancestors who were there during our Master's time nearly 2,000 years ago

SYMPTOMATIC ENDOCRINE THERAPY FOR INSANITY

By SIEGFRIED BLOCK, A.M, M D, F A C P, BROOKLYN, N Y

MANY papers have been written on insanity caused by the hormonic workings of endocrines Nothing that is entirely new is offered here, but rather a substantiation of the multitudinous experiences of other observers The endocrines were used to combat symptoms of the mental conditions regardless of the diagnoses, thereby differing somewhat from former therapy The following cases are noteworthy —

M C Referred by Dr G Wolff The patient was a girl of 19 years, diagnosed as a typical dementia praecox of the paranoid type She was acting as a counsellor at a summer camp Suddenly, she developed ideas of persecution One evening the camp was startled by a voice exclaiming, "The black man was after me!" The patient had hallucinations, both auditory and visual, mistaking the camp nurse for a bewitched woman She became overactive physically She ran about and had to be restrained, soiled her clothes, refused food, and laughed and cried alternately The following day she played with her feces and attempted to eat them

The patient was kept under full restraint When gr 1/15 of hyoscine was given, she became temporarily quiescent, but no genuine improvement was noticed until pituitary and adrenaline were prescribed Then her blood pressure which had been low, became higher As the pulse became slower, thyroid, gr 1, was given three times daily Menstruation ceased for two months, and thereupon ovarian extract, gr 5, was ordered These endocrines were manipulated so that luminal and bromides were administered when she became too agitated from the thyroid A complete recovery has resulted in this case

L C Referred by Dr A Roth The patient, a male 30 years of age, a teacher of drawing in a secondary school, developed a typical paranoid praecox He had delusions of persecution, mistaken identity, loss of orientation as to time, place and person He refused food, could not be forced out of bed, was assaultive and very negative, he prated about his sex life and imaginary loves He claimed to have been hypnotized by people who used this means to pick his purse

Medication consisted in large measure of ovarian extract and pituitary gland When he became very voluble or assaultive, large doses of pituitary and ovarian extract were administered, in addition to subcutaneous injections of hyoscine, gr 1/400

All treatment seemed without influence until the ovarian extract was administered Complete recovery has now resulted in this case.

B D Referred by Dr J Broun The patient in this case is an artist, 27 years old, the only daughter in a family of seven sons Subsequent to a sexual episode the girl had come to New York from Washington She developed a series of wild hallucinations and delusions with a phobia for men She masturbated continuously She was put under complete restraint and tube fed Testacoids were administered in tablet form three times daily, and in addition a nocturnal dose of canabis indica, gr 2 Under this therapy her first menstruation was a profuse hemorrhage Anemia developed, and this was treated with iron arsenic and pituitary (posterior lobe), gr 2, three times a day

Gradually her emotionalism subsided. She has been restored to her family in Washington, and for the past six months is apparently well

H W Referred by Dr Wranna This case is one of a single girl, 25 years old, who two summers ago engaged in a festival amour Last summer she prevailed upon her parents to visit her haunts of the previous year Her lover was not there! Day after day she sat on the same rock, crying Her family, unaware of the love affair, was at a loss to interpret her actions Gradually she became more depressed She cared little for food. Anemia soon followed Her condition grew worse She masturbated continuously, used vile language, and attempted suicide by gas

The case was diagnosed as one of manic depressive insanity Treatment was rendered at home, and consisted of testacoids and testicular extract, gr 1/10, plus high colonic irrigations A strict vigilance was kept to correct the masturbation The blood pressure was 120 systolic and 90 diastolic, but the pulse varied from 58 to 65 To increase the pulse rate, thyroid was increased from gr 1, three times daily, to gr 2, without increasing the frequency of the dosage

Although the testicular extract is still being continued, the girl seems to be restored to normal and apparently has made a complete recovery

H O Referred by Dr G Smith The patient in this case was a male, 14 years of age, who weighed about 208 pounds and was 5 feet, 11 inches in height. He was a well-developed boy of exceptional muscularity, a dancer, eloquent—in short, he might be called a "Beau Brummell" had he been ten years older The lad was ever boastful of the num-

ber of girls with whom he had indulged in sexual intercourse

He was brought to the notice of the writer because he had been arrested charged with having raped a girl of six It was noted that in his cell he acted peculiarly On examination it was manifest that, in addition to an exaggerated ego, he had an overabundance of sexual desire. He had a history of recklessness that went far beyond the goal posts of sanity Then followed a period when he refused food He occupied himself with incessant talking, this steady stream kept up until he was so hoarse that it was difficult to understand what he was saying He was never rough or rude, always of unusual sweetness

This case received paraldehyde, oz ½ On the following day he was given 1/100 of hyoscine, three times, hypodermically He slept most of the time. When he was permitted to come out of the influence of the hyoscine, his symptoms seemed better, he was less agitated. However, he did not seem to make any marked strides in a week At the end of seven days he was given ovarian extract, gr 5, and whole pituitary gland, gr 5, three times daily Almost as if by magic, improvement was noted.

The rape case had been thrown out on the grounds that the boy was a case of diapituitarism, plus a gonadel disturbance For the past two years he has been getting whole pituitary gland, gr 2, in addition to ovarian, gr 2, three times daily He now attends a military academy, and seems to be normal

G A. Referred by a nurse The patient is a female, who, at the age of 37, had never been pregnant. She made the following statements "I am a man of 37," and, again, "It's not so easy now," later, "I am independent of you" At times she was the victim of visual hallucinations, seeing men, women, boys, and girls moving in circles Her past history was negative with the exception of an operation for a fibroid and chronic appendicitis, one and a half years previous Two months subsequent to the operation she became moody In an endeavor to ameliorate her mental condition, she took a position, and submerged herself in the work As salesgirl she fell into difficulties with the manager At the examination she declared that "He tried to hypnotize me, control me and upset me physically, I would not lose my head—walk to him. Whenever I entered the store I feared him" Later, she declared, "I am self-conscious, entirely devoid of outside interests There is a man inside of me who talks continuously; when I attempt to do something, he says [illegible]"

She had tremors, tachycardia, was neurotic, and had lost 22 pounds Her pulse rate on first examination was 140 and her weight 122 pounds

Treatment was as follows —Thyroid extract, gr. 1/50, three times a day, ovarian extract, gr 10, three times a day Although her symptoms pointed to insanity of the dementia praecox type, it seemed that the hormonic unbalance of the thyroid and gonads was particularly at fault.

The patient returned after two weeks On second examination she weighed 132 pounds and had a pulse rate of 74 The next examination showed an additional gain of five pounds in weight and a still lowered pulse

At present the hallucinations are much less marked She is still under treatment

B R Referred by Dr Herman Patient a female, aged 38 years She had suffered considerable loss of weight. The blood pressure was 90 systolic and 60 diastolic, with a pulse of 140 She stated that she had developed an antipathy towards her husband which she could not well explain All that could be gleaned was that she was sentitive to his body odors, his lack of cleanliness, sexual perversions, etc She confessed to being well treated by him The patient is the mother of four sons and one daughter Strangely enough she holds a hatred for the boys similar to the hostility toward their father, but she is an over-zealous worshipper of the daughter A constant depression rests on her Physical signs of the menopause have been manifest since the birth of the girl Two attempts at suicide were made, both by gas

Treatment consisted of ovarian, gr 5, every 4 hours, whole pituitary, gr. 5, three times a day, luminal, gr 3, at night.

She is wonderfully improved and her attitude toward her husband has changed to one of genuine affection She is still under treatment.

F F. Referred by Dr T Fisher This case was diagnosed as involution melancholia. The patient is a woman, aged 49 years, whose case started as an increasing depression, for which she was given thyroid and ovarian extract. A number of times in the course of the therapy symptoms of hyperthyroidism were manifest. She was treated with chloral, gr 5, three times daily, and given saline cathartics Potassium iodide, gr 20, was administered for arteriosclerosis

Not only has the progress of this condition been arrested, but the patient is greatly improved. She is still under treatment.

R. B Referred by Dr Charles Fisher. The patient, a female, 25 years of age, a stenographer by occupation, awoke one night cry-

ing that she was tired of being respectable She cursed all men and said that she had a dream in which she was informed that it was foolish to be good That stealing, murder, and crime was the only life that paid She refused to go to work the following morning, bleached her hair, painted her face with an overdose of rouge, and lay on the bed and cried all the rest of the day until she fell asleep The next day she did not get out of bed at all At this time she began to menstruate much more profusely than ever before She gradually became more and more depressed, soiled the bed, and refused practically all food She talked very little Soon catatonic phenomena developed She came into our hands about two weeks after the onset The diagnosis was catatonic dementia praecox The parents refused to send her to a sanitarium, so she was treated at home Forced feeding, cold and hot baths, massage, and thyroid extract, gr 1, with one grain of orchitic extract, three times a day, was administered The improvement was quite rapid, and in four weeks she was apparently well again She has gone into training in one of our large hospitals and seems to be quite normal

It is now three years since she was first seen, and although she has been examined occasionally, no trace of her former mental condition is noticeable Many catatonic praecoxes clear up, but the rapidity of recovery, the absolute lack of neurotic taint noticeable after the cure, and the onset of the menorrhagia, together with the mental state of sexual excitement, forced us to believe that the orchitic extract played a large part in the result obtained

E N Referred by Dr S L Green The patient in this case was a young married woman of 22 years, whose child had died three days after birth, from an infection She became depressed, excited, and had delusions of persecution She began to talk about her husband, and many times said she hated him and wished him far away She contended that he impregnated her and then killed the baby After a few weeks she became quite mute. All men were looked upon as evil, and she would not remain in their presence A case of dementia praecox with delusional trends, based on an antipathy for the opposite sex, seemed at hand We could not get this girl to take any medicine, therefore ovarian extract, gr 3, each day was injected hypodermatically The idea was to arouse her own female hormones to get her more "effeminate," as we term it No improvement was noted for several weeks, but at the end of five months the whole condition had changed The medication was continued for a year Now she has another baby She is a dutiful wife and gives one the impression that she loves her husband and his family very sincerely

We have had similar experiences in "boosting" a male or a female hormone The results in many cases involving neurotic disturbances of puberty, including some of the psychogenic sexual disorders, are worthy of note

This resumé of a few cases is given for the sole purpose of emphasizing the fact that too much psychotherapy without drugs is being used That all mental conditions must have some sort of a physico-chemical basis That we do not thoroughly understand this at present But we do recognize that certain glandular hormones have known characteristics Why not make more use of what we know of these biochemical facts? We believe that a combination of all forms of medical treatment is in order, and that none should be excluded

---

THE GOLDEN AGE IN PUBLIC HEALTH WORK*

By WILLIAM A. GROAT, M D, SYRACUSE, N Y

AS a part of a plan for discussion of Public Relations and Public Health problems at this session, I have been asked to give a brief survey of the developments in Syracuse, a typical upstate city, and in Onondaga County, one of the largest counties of the State of New York, and of which Syracuse is the urban center

On January 16, 1894, the Syracuse Academy of Medicine was founded with Dr H D Didama, Dean of the College of Medicine, as its first President. Article I, Section 2, of the Constitution adopted at that time and which still stands, reads as follows

"The objects of this Academy shall be

"First—The Cultivation and the advancement of the Science and Art of Medicine.

"Second—The promotion of public health

"Third—The maintenance of the honor, character and the interests of the Medical Profession"

One of the first public health duties of the Academy was to finish the long campaign of our medical organizations for a better city water supply Those of you familiar with public health

* Read at the meeting of the Fifth District Branch at Watertown, N Y, on October 17, 1929

activities of that period know how directly the members of the medical profession were concerned in them. No others seemed interested This direct public health influence of the local medical profession through its organized body continued through the years, and, in 1911, under the administration of Mayor Schoeneck, the Mayor, upon the suggestion of influential members of the medical profession, appointed an Advisory Committee to the Mayor in public health matters This committee comprised the leading members of the profession of that day, notably Dr John L Heffron, Henry L Elsner, Nathan Jacobson, John VanDuyn, B W Sherwood, A C Mercer, and several others of lesser fame but equal interest This committee, an entirely new idea at the time, was an informal one without legal standing, but was frequently consulted, and, over a period of years, helped to guide the public health destinies of the city

In 1917 during the administration of Mayor Walter Stone, the public health administration of the city was still through a bureau of the Department of Public Safety according to the White charter which had been adopted in 1906 Dr David M Totman was then health officer, or Bureau chief, under the direction of the Commissioner of Public Safety Dr Totman first entered Public Health work in 1906 on a part time salary devoted his life to public health work as a citizen, a student, a man of culture and enterprise, of most ingratiating manner and delightful personality Some of his assistants and the medical profession in general chafed under the restraint of being but a Bureau Dr Totman, however, smoothed the difficulties and maintained his positive relations with the Academy of Medicine It is noteworthy that during the first period of his activities, from 1906 to 1913, an unusual number of papers on public health topics were presented and the public health committee was active in campaigns for the protection of the shores of Skaneateles Lake, meat inspection, clean milk, and typhoid fever control. During an extensive scarlet fever epidemic, through the voluntary aid of the doctors of Syracuse, led by action of the Academy of Medicine, every school, every factory and every store in the City of Syracuse was surveyed by members of the Academy and all occupants or employees inspected Talks on prevention of infection were given by members of the Society in designated places Many undiscovered mild cases of scarlet fever were brought to light and the epidemic quickly closed Dr Totman was succeeded by Dr F W Sears who, in turn, resigned to continue as District State Health Officer for the State Department of Health.

In 1919, however, the tension between the Bureau of Health and the Commissioner of Public Safety became so tense that some resignations followed, and the Advisory Committee to the Mayor performed able service in helping Dr Totman, who had returned to office, through a trying period As a result of the controversies which arose at this time, in 1920, with the help of the Mayor as advised by his informal Advisory Committee, still an active coordinating agency, and the valuable services of the Corporation Counsel at that time, Mr Edmund H Lewis, the city charter was amended, creating a Department of Health, headed by a Commissioner The amendments also made the unique provision for an official body known as the Advisory Committee to the Mayor in public health matters This committee of five the charter provides is appointed by the Mayor from a panel of fifteen names nominated annually by the Academy of Medicine

The first Commissioner of Health was Dr Henry A MacGruer, Major M C, just returned from overseas where he had been in charge of skin and venereal disease in combat troops of the American Army under the direction of Dr Hugh Young, Col M C Dr MacGruer organized the department as it is today and administered it successfully sacrificing, as did his predecessors, his private practice

Following Dr MacGruer, Dr O W H Mitchell was appointed Commissioner of Health under Mayor Walrath Dr Mitchell resigned after a short period of service because of ill health but continued in an advisory capacity He was then and still is Professor of Bacteriology, Hygiene and Sanitation in the College of Medicine and is at the present time Director of Public Health Service for the entire University and a member of the Public Relations Committee of the Medical Society of the State of New York

He was succeeded by Dr Thomas P Farmer Again we find a medical practitioner serving the city Dr Farmer later resigned but continues his public health activities as Chairman of the Committee on Public Health and Medical Education of the Medical Society of the State of New York.

During Dr Farmer's administration, on invitation of the Board of Estimates and Apportionment and the Common Council, the two bodies representing the city officially, the medical profession and various civic lay bodies too numerous to mention, the Milbank Foundation chose Syracuse as a city where it would place one of its demonstrations Syracuse had a reputation prior to the organization of the Syracuse Health Demonstration as being above the average for cities of its size both in health activity and health expenditures These facts were recognized by the Milbank Fund and were a predominating influence causing the selection of Syracuse for their demonstration

Following the resignation of Dr Farmer, Dr Herman G Weiskotten, Dean of the College of Medicine, was appointed Commissioner of Health Again we find a man making personal sacrifice to accept an official position through his sense of duty as a member of the medical profession.

Since his resignation, Dr Weiskotten continues as Dean of the College of Medicine and has been a member of the Committee on Public Health and Medical Education of the Medical Society of the State of New York During Dr Weiskotten's administration the profession, particularly the Pediatric Club, chafed under what seemed to them to be an invasion of private practice by public health activities The Academy of Medicine appointed October 18, 1927, a special committee for the study of cooperative relationship between the medical profession in Syracuse, as represented by the Syracuse Academy of Medicine, and the health and welfare agencies both public and private In December, 1928, following preliminary reports in which it appeared that matters under discussion were being ironed out, it rendered its final report In this report the Committee called the attention of the Academy to the progress which had been made, pointed out the confusion in the minds of the profession as to responsibility for certain errors and deficiencies and invasion of the field of medicine, and asked them to inform themselves concerning these differences They recommended that eleemosynary institutions establish efficient social service departments to control the deplorable tendency to measure the value of clinics and surveys by volume rather than by quality, and halt the extension of gratuitous service to those not requiring it thereby undermining self respect, and serving only to protect the criminal, predatory class It was the opinion of this committee that so-called lay welfare organizations had a distinct place and a firm duty and that their efforts along proper lines should be welcomed It stated as its belief that such agencies should recognize the leadership of organized medicine, arouse public interest and assist medical science in its further efforts This special committee's report went on to say that the public relations of the medical profession through the Academy of Medicine had come to be an important matter and, realizing the enormity of the problem, that it is a continuous one, a matter which the individual cannot well handle, but which is, nevertheless, of great importance, recommended that there be a standing committee of the Academy of Medicine to be known as the Public Relations Committee whose duties be to take up matters referred to it by the Academy and to initiate such action as it deems necessary within the scope of the public relations of the Academy of Medicine The committee offered amendments to the Constitution to that effect, which were adopted

On June 27, 1928, the Advisory Committee on Public Health, which had been most active throughout the winter, learned from the daily papers that Commissioner Weiskotten had resigned and that the Mayor had appointed Dr Ruhland as Commissioner of Health, the exchange to take place August 1st That afternoon all members of the Advisory Committee resigned In their report to the Academy at a special meeting three days later, the committee gave the reasons for their summary action It called attention to the fact that the charter of the City of Syracuse provides that the Mayor appoint such a committee and the committee as appointed had resigned at this time because the important association and proper relationship as provided and intended by the city charter had been disrupted by the action of the Mayor Outside advice was being taken without consultation with his official advisors That the committee favored a full time Commissioner of Health, the Academy having advised it, coupled with adequate remuneration for the establishment of a department in 1920, was stated That their action in no way involved Dr Ruhland, a member of the Academy, was made clear The report, in full, appeared in the daily press and was well received At the special meeting at which this report was offered and accepted, a committee of fifteen of the Academy of Medicine was appointed to investigate the situation, and the Onondaga County Medical Society a few days later appointed the same committee to represent it This committee, of which Dr O W H Mitchell was Chairman, studied the situation for a period of six months and accumulated a vast amount of material related to the questions involved It presented its report reaching the following conclusions

1 Contributions from voluntary organizations and funds for public health work are to be encouraged

2 The original plan proposed in the bulletins of the Milbank Fund for conducting the Syracuse Health Demonstration, if strictly adhered to, presumably would be satisfactory to all concerned

3 A voluntary agency cooperating with a government agency should adhere to a policy which will keep the activities of each separate and distinct.

4 Full time government employees should devote their entire time to government duties and receive their salaries through government channels only, and be responsible to the government alone

5 Persons who are non-residents should not be employed for government duties except when local personnel of suitable qualifications are not available

6 For many years the closest cooperation existed between health officials and physicians For the past five years such close relationship has not existed This accounts for some of the misunderstandings which have arisen.

7 The physicians of Syracuse are and have been for many years in favor of a full time Commissioner of Health

It recommended to the Onondaga County Medical Society and the Syracuse Academy of Medi-

cine that the Constitution and By-Laws of each provide for a standing committee to be known as a Public Relations Committee It is suggested that the personnel of these committees be the same in each society

The recommendations regarding the appointment of Public Relations Committees were adopted

Dr George H Ruhland was appointed full time Commissioner of Health, taking office on August 1st Dr Ruhland, who had been Deputy Commissioner of Health under Dr Farmer and Dr Weiskotten, is a man thoroughly trained in public health work, and had established himself as a citizen of Syracuse He is a member of the Academy of Medicine, interested in its affairs, frequently consults and asks advice of the Academy The Mayor of the City of Syracuse, following the report of the investigating committee, which committee he had assisted in its work, asking for helpful criticism regardless of where it might fall, on January 19, 1929, accepted the resignations which had laid in his hands since the previous July unacted upon, and appointed a new Advisory Committee from a panel submitted by the Academy of Medicine as the city charter provides This committee is functioning, and while we are still confronted by the general problems of the day which will later be referred to, it seems to most of us that the local situation has been very much clarified

Upon analysis of this brief sketch one can but find that the development of governmental public health work in Syracuse to the level it is at today, has been largely through the public spirited interest and advice of the organized medical profession, and in particular to the personal efforts of a succession of local practitioners, practically all of whom, in an amazing way, have continued their interest in public health work in various ways, many of them rising to positions of greater scope and importance in that field

I believe a survey in almost any other community would show similar relationships and accomplishments

So we find the organized medical profession of Syracuse to have passed through the vicissitudes and to have been confronted by nearly all the problems common to the profession generally We have had some burdens the rest of you have escaped.

The golden age in public health work will come when the medical profession, governmental health departments, welfare agencies and the Entrepreneurs understand and recognize each other in true value and work together This is of course a mere platitude. It is saying that with the millennium there will be peace on earth Let this platitude serve as introduction to what I would say relative to what we as a profession may do to bring about a better understanding, and what we have a right to expect from others to that end

The medical profession is the oldest welfare organization by many centuries Even today all welfare organizations, educational, corrective, and charitable, lean upon medical science for doctrines and on its practitioners for applications to humanity

For many years the entire organization and machinery of state medicine, such as it was, rested on the shoulders of practicing physicians, who alone showed interest.

Governmental health activities however have sound theoretical basis That the state has interest in the health of its citizens is basic governmental principle Medical practice laws are based on this same principle and the right to practice is a privilege conferred by the State So long as these medical practice acts stand, the practice of medicine remains So long as we behave like human beings, practitioners of medicine will be required It is the business of the profession to meet changing conditions, recognize social developmental ideas, and demonstrate its ability to assimilate and to lead So long as we are the source of medical knowledge and progress and the ultimate distributors of the great bounties conferred, our position is secure The day of high sounding phrases, mystery, occultism, empirism and placebos in medicine is passing

As a profession we may feel that the state is invading the practice of medicine It is the business of the organized profession to continue to assist in the proper development of the thing it itself has so largely created, and show wherein ideas of further development invade the sphere of medical practice in such a way as to endanger the health of citizens of the state

For example A rural community needs governmental help for the establishment of laboratories, health centers, and technical assistance in order that the health of the denizens be cared for by practitioners of medicine whom the state itself has declared are alone qualified to treat disease If the state through paternalistic interest gives too much, has nurses or others doing some of the simpler things which doctors do, the practitioner may be lost to the community, and the things which he alone is qualified to do, by training and by law, are left undone and the community suffers The interest of the state is in the health of its citizens Such practices defeat its objects and are contrary to its own laws The profession gains nothing by pointing to its high ideals and noble sacrifices, by talk of the taking of bread from our mouths, and appeals for the good old days of saddlebags, senna, and sentiment. Show how it takes bread from the mouths of the de-

pendents of the sick if they are without full medical care

So far as the Entrepreneurs are concerned, the economic tendency is to get rid of the middleman The public can be educated, convinced, and even sold, as we so often hear, and what these organizations have to sell by their own declaration is a product of medical science Can we not keep in touch with them while they are still in operation, direct them along right lines that they sell only goods of sound character and proved use, and prevent them from making too extravagant promises as to what we, engaged in medical science, can actually do toward elimination of disease? Remember that there are great foundations which spend large sums of money in medical research and public health research in the most scientific and strictly ethical, pure sciential manner

I have often wondered whether we should not be psycho-analyzed as a profession It seems to me we resent most the self laudation and press propaganda of these Entrepreneurs We get unnecessarily upset over the way they point with pride to this or that as though it were their accomplishment instead of largely ours We are particularly disturbed, and not without reason, when they lay claims to the falling tuberculosis rate, whilst our pure science investigators are puzzled to fully account for it, and fear a reversal toward former high death rates

Their methods, too, are necessarily different from ours The physician in going to the laity is bound by custom and professional ethics In his professional presentations he must obey the rules of research, be cautious not to confound theory and speculation with fact, and, in presenting facts, present all of them, and be extremely cautious in drawing dogmatic conclusions He cannot understand the free style of the propagandist, education by publicity, and high pressure salesmanship methods as applied to public health questions by lay writers

Again, lay writers naturally tend, like patients, to grasp the spectacular, the sentimental and the superficial aspects, ignoring the part of true scientific interest and importance The lay mind sees the story, the trained mind the fact Medical publicity by medical organizations is now, though but recently, an accepted fact The magazine *Hygeia,* the A M A broadcasting, radio talks under direction of organized medical bodies in many other large cities are laudable examples

There is much we can accept in these so-called selling methods without sacrifice of principle or danger to the truth There is much we might do to curb the enthusiasm of those lay organizations that would, if left to themselves, promise more than medical science could fulfill We must not, however, take adverse propaganda too seriously The world is full of propaganda for and against anything and everything, navies, cigarettes, sweets, college athletics, and eighteen day diets There is enough released daily to wreck all business, all science, all religion—if it were really a genuinely effective method Now we are beginning to get propaganda against propaganda!

To a certain extent we may watch and wait, but we must be organized In this state, every county society should have a committee on public relations, co-ordinating with the state committee In addition each city at least, each important center, should have some mechanism for the dissemination of sound medical information Every library should be receiving *Hygeia*

In addition to the medical profession and its coadjutors, dentistry, engineering and nursing, there is another class interested in public health work These are organizations which, backed by sufficient funds, seek to advertise the principles, demonstrate the value, organize the administration, and in some instances control public health work They accept the researches of medical science and have no other source for such information, and claim none In their enthusiasm they now and then accept something as the last word in a way that surprises the trained mind They do no research, other than statistical, no charity except experimental, and in general and in brief declare themselves as completely sold with the idea that public health is purchasable, that medical science is sound and their sole mission is to demonstrate the fact, help organize public health work and convince the public everywhere that larger expenditures, better facilities, larger staffs, more nurses, better buildings for public health purposes pay in lives, in efficiency, in happiness and in dollars and cents They would act as representatives, publicists, organizers and selling agents for scientific fact and welfare ideals They are Entrepreneurs, middle men between the producer and the consumer I quote from the 1922 and 1923 bulletins of the Milbank Fund as examples

"This objective, first announced in May, 1922, is being approached, not through the creation of new organizations and machinery, but by the utilization, in line with the precedents of the Fund, of existing official and voluntary agencies In communities selected or to be selected for the work, local participation and initiative, local official and voluntary health and medical leadership are essential"

"It is a demonstration by Syracuse, not on Syracuse"

"It was made clear at this time that the Demonstrations were not to set up additional machinery, but that the Fund anticipated the

accomplishment of its aims through established agencies

"During its existence, the Fund has not undertaken to set up any independent operating agencies but has sought to reach its social objectives by the utilization of existing organizations, official and voluntary, or by the initiation and temporary provision of activities where none exist but are needed In its work, it has attempted to operate with, and contribute through, enterprises soundly established, of strong existing organization and personnel"

"As a result of past experience of the Fund and as an outcome of studies made in 1922, the Board of Directors on April third of that year authorized the support of a plan which would attempt to demonstrate, by cooperation with three typical communities embracing a population of half a million people, whether by intensive application of known health measures the extent of sickness in the United States can be further and materially diminished and mortality rates further and substantially reduced, and whether or not such practical results can be achieved in a relatively short period of time and at a per capita cost which communities will willingly bear"

In closing let me quote from a preliminary article by Dr Ray Lyman Wilbur, President of Stanford University, formerly President of the American Medical Association, as Chairman of the Committee on the Cost of Medical Care, which includes practitioners, public health officials, directors of institutions, economists and eminent citizens

"Medicine has become an applied science in which the art of medicine must rest upon a fact basis or become a comparative failure'

"We live in an economic age, but medicine as an organized profession does not fully realize it"

"Medicine stumbles ahead as a great social factor led by a few far-seeing individuals, prodded by a lot of uplifters, legislators, and enthusiasts, and with a well-developed defense complex against those changes which come to all growing things The practice of medicine can only be fully understood by those who have lived it, and yet, unless the profession bestirs itself, great changes in medicine will take place through the instigation and pressure of outsiders The golden thread of human understanding and of close personal relations between doctor and patient may be left out of the new social fabric which is being woven right under our eyes

"We must face the facts, we must study them to see what they mean, we must guide ourselves by what they tell us, not by traditions and thinking, that belong on the retired list"

MANAGEMENT OF INFECTED ABORTIONS*

By JAMES E KING, M.D, BUFFALO, N Y

INFECTIONS following abortion are much more frequent than infection following labor, the reason being that a large number of early pregnancies are terminated by the abortionist or are induced by the patient herself Spontaneous abortions also are not infrequently infected by procedures to empty the uterus surgically

The pathology and clinical manifestations of infected abortions obviously present much the same picture as is seen in infections following labor at term The infection in both instances is favored by similar conditions The placental surface with its thrombotic veins, and the freshly exposed decidual surface, offer in both the same favorable field for the introduction and spread of bacteria The sepsis of abortion, however, is frequently complicated by the presence of a retained placenta and for this reason the management of the infected abortion presents problems peculiarly its own.

Any rational treatment of infected abortion must be based upon a knowledge of the bacteria commonly found in such infections, their behavior in the tissues, and the pathology they produce The same general principles governing sepsis elsewhere apply to infection of the uterus The uterus, however, is not only particularly suited for the introduction of bacteria but because of its anatomical structure it more readily favors their spread The uterus at all times has an abundant blood supply and a rich lymphatic drainage These both, under the influence of pregnancy, are much increased The placental site becomes a network of sinuses which post partum are filled by thrombi that offer ideal culture material for bacteria In addition to this, the anatomical relationships of the uterus with the loose cellular tissue of the parametrium and the direct tubal communication with the peritoneum, suggests the wide range of pathology that may result from these infections

Equally as important as an understanding of those conditions in the uterus that favor sepsis, is a knowledge of the essential characteristics of the bacteria chiefly concerned At term, in

* Read at the Annual Meeting of the Medical Society of the State of New York at Utica, N Y, June 5, 1929

the great majority of instances, the streptococcus is the only agent with which we have to deal So, too, in abortion, the streptococci predominate as the infecting bacteria but in addition, because of the frequently retained placenta, the saprophytes often play an important role

For the practical purposes of this discussion infected abortions may be classified into the following four groups, based upon the infecting agent and upon whether the abortion is complete or incomplete

First The complete abortion with streptococcus infection

Second The incomplete abortion with streptococcus infection

Third The incomplete abortion with a mixed streptococcus and saprophytic infection

Fourth Incomplete abortion with saprophytic infection alone

This grouping assumes importance because the management of an infected abortion depends upon the group in which the particular case belongs It would seem, therefore, essential first to consider the behavior and peculiarities of the two types of bacteria concerned and to define what particular bearing those characteristics have in determining treatment

The streptococci embrace a large group morphologically the same but which show wide variation in their virulence and predilections Until it is known in how far these characteristics are inherent in the germs themselves and in how far the germs are controlled by factors inherent in the individual, there can be no scientific basis upon which to explain their protean manifestations Practically one comes to recognize their difference in virulence by the clinical evidences One of the outstanding characteristics of the streptococcus is that when implanted upon a favoring surface, it tends at once to invade the living tissues In the uterus the ultimate pathology that may result is varied and often most complicated in its relationships The extent and character of such pathology depend upon the virulence and the methods by which the infection has spread

With the introduction of the streptococci upon a placental surface there are three immediate possibilities The infection may be carried into the uterine muscle where it may remain, to be retarded in its further spread by the round cell infiltration described years ago by Bumm Or, the bacteria may be carried at once by lymphatics to more distant tissues or be emptied directly into the blood stream Finally, the thrombi in the sinuses may be promptly infected and later, by the extension of these septic thrombi, the large veins of the pelvis become involved

It is not pertinent to this discussion to trace from these beginnings the ultimate and complicated pathology that may result It is, however, of the utmost importance to clearly appreciate the one outstanding fact, that at every stage of a streptococcus infection the bacteria are within the living tissue Proof of this completely changed former views upon the treatment of these infections, for it became apparent that any intra-uterine manipulation tended to break down nature's defense and to further disseminate the infection

Compared with the complicated relationships presented by the streptococci, the saprophytes present a simple problem The saprophytes constitute a considerable group that live upon dead organic matter and in the living body produce symptoms through the absorption of the toxins elaborated by their growth These bacteria do not invade living tissue and in that sense are not pathogenic To deal with them clinically it is only necessary to remove the tissue upon which they grow This indication is based upon a sound logic entirely justified by clinical experience In the management, therefore, of infected abortions the physician has two well established principles to guide him non-interference, in the case of the streptococcus, and interference, in the case of saprophytic infection The problem, however, is not as simple as it might appear The varied clinical features associated with abortion may so complicate the indications that the nicest judgment is required

Infected abortions have been classified above under four groups, based upon the type of infection and upon whether the abortion is complete or incomplete Group one comprehends the complete abortions with streptococcus infection Concerning this group there can be no argument or difference of opinion These cases are to be left severely alone Interference here not only can do no good but is capable of doing much harm Group two, the incomplete abortion with streptococcus infection, might be as easily disposed of as group one were it not for the fact that the presence of a retained placenta may give rise to complications requiring relief Severe bleeding is the most common condition demanding attention An incomplete abortion with sepsis accompanied by hemorrhage finds the physician confronted by a real problem Shall he remove the placenta to save the blood required to combat the infection if by so doing he adds the risk of further spreading that infection? With a cervix undilated certainly no attempt to empty the uterus should be made A firm pack to control the bleeding and to promote contractions is the proper procedure With a well dilated cervix, retention of the placenta means

that it still is attached to the wall of the uterus Here a pack may be tried If it fails and hemorrhage persists, one may, as a last resort, most carefully attempt the placental removal by the ovum forceps Under no circumstances should a curet be used The ovum forceps should only be used in the presence of bleeding with a dilated cervix, after all more conservative methods have failed

In group three, the incomplete abortion with mixed infection, a new question presses for answer Shall one follow the indication to remove a decomposing placenta or remain inactive because of the presence of a streptococcus infection? On this question there is difference of opinion There are those who take the position that there is never indication for removing the placenta under such circumstance and there are those less conservative whose procedure is determined by conditions in the individual case It would seem that a decomposing placenta adding its toxin to a patient fighting sepsis can only decrease resistance If, in addition, the placenta is causing undue bleeding a second indication for its removal would be present

Under these circumstances with a sufficiently dilated cervix removal manually or by the ovum forceps may be considered In this group, also, the cervix should not be artificially dilated as the trauma can only spread the sepsis The management of this group requires good judgment based upon experience, and when any interference is undertaken the procedure must be conducted with due regard to a proper technique.

In dealing with group four, the incomplete abortion with saprophytic infection, the problem would seem a simple one, but here too there is a group who contend that these cases should be left to nature Such a policy is inelegantly but expressively characterized as an infection "stinking itself out." There can be no question that simple saprophytic infections do occur and allowing such a case to linger and to treat it expectantly would seem a policy open to grave question It certainly violates surgical principles

The foregoing views are based upon the assumption that, in a given case, one is able to recognize the type of infection present This opens up a broad field for discussion and unfortunately we have no clinical criteria on which we can base an infallible judgment. Theoretically, and to a large extent practically, examination of smears from the cervix give fairly reliable information.

Finding the streptococcus in smears does not, however, determine the virulence The clinical syndrome must also be given due consideration in reaching one's conclusions It is not within the scope of this discussion to elaborate upon the early clinical evidences of infection Such manifestations are complicated and varied in the extreme Initial reaction of chill and high fever may usher in an infection of slight significance while a serious sepsis may early show little reaction It is here that experience is required to evaluate the symptoms and clincal findings and from them to reach a sound judgment as a basis for treatment

A few outstanding indications in the treatment of abortions may here be presented They are generalizations which naturally are subject to modifications required by the individual case

Every abortion should be regarded as a surgical case in the sense that it demands in its management the strictest surgical asepsis

Whenever possible hospital care is wisest and if intervention is required, approved surgical technique of the hospital is demanded

A dirty pack is as potent for infection as a dirty curet.

Every abortion with an admission or suspicion of having been induced should be regarded as infected until proven otherwise

The infected incomplete abortion is the real problem Shall the placenta be removed? If so, when and how?

Indications for removal are hemorrhage, saprophytic infection, and obstruction to drainage Before removal the cervix should be dilated by natural forces The ovum forceps and not curet should be used and utmost gentleness employed

---

THE SEE-SAW AS A THERAPEUTIC AGENT IN CEREBRAL ARTERIAL SCLEROSIS

By ARTHUR H TERRY, JR., NEW YORK, N Y

THE idea that the see-saw might be of benefit in cases of poor cerebral circulation, due to narrowing of the lumen of the cerebral arteries, was deduced from the benefits obtained by the Buerger exercises in Arterial Sclerosis of the legs The exercises are briefly described by Buerger in the following manner "The affected limb is elevated with the patient lying in bed, to from 60 degrees or 90 degrees above the horizontal, being allowed to rest upon a support for thirty seconds to three minutes, the period of time being the mini-

mum amount necessary to produce blanching or ischemia As soon as blanching is established, the patient allows the foot to hang down over the edge of the bed for from two to five minutes, until reactionary hyperemia or rubor sets in, the total period of time being about one minute longer than that necessary to establish a good red color The limb is then placed in the horizontal position for about three to five minutes, during which time an electric heating pad or hot-water bag is applied, care being taken to prevent the occurrence of a burn The placing of the limb in these three successive positions constitutes a cycle, the duration of which is usually from six to ten minutes These cycles are repeated over a period of about one hour, some six to seven cycles constituting a seance"

The see-saw consists of two parts, first, an upright post which is properly supported by a base This central post or fulcrum is so

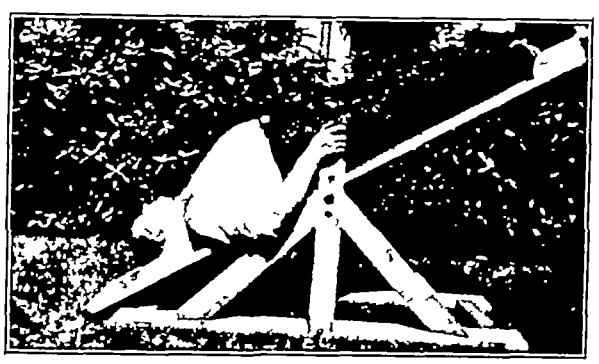

FIGURE 1

notched as to allow different elevations of the board which is suspended upon it It is also so constructed as to act as a handle for the patient who lies upon the see-saw The second part of the see-saw consists of a stout plank about two inches thick, two feet wide and seven feet long This plank has shoulder braces at one end and a foot brace at the other so as to prevent the patient from slipping when the head or feet are in the downward position The plank rests upon the central post, or rather the iron between the two central posts, so that it is practically balanced when the patient is on board It is, therefore, very easy for the patient to lower and raise himself to any angulation desired without any assistance

Exercises are given to the patient in the same way as the Buerger exercises for the legs but at not such extreme angulation

(1) The head is lowered 10 to 15 degrees for about two minutes

(2) The body is on a level for two or three minutes

(3) The head is elevated 10 to 15 degrees for two or three minutes By these treatments

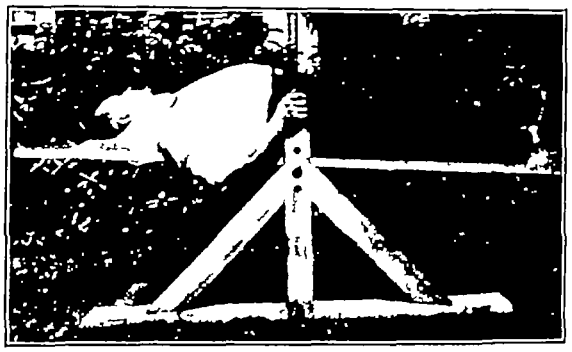

FIGURE 2

the brachial blood pressure is raised 10 to 15 millimeters of mercury when the head is down, and lowered 10 to 15 millimeters of mercury when the head is up

Shortly after each one of the treatments there is frequently an improvement in the cerebral circulation This is manifested in a symtomatic manner by the patient being relieved of a certain amount of confusion and headache and objectively it is noted that the color is improved and the mental condition is improved

One specific case, who was so confused mentally that he was not able to recite a simple ditty, was so improved by these exercises that he could recite the entire poem without hesitation, also, whereas he had previously been unable to attend to his business affairs and unable to sign checks, he was able to resume these tasks

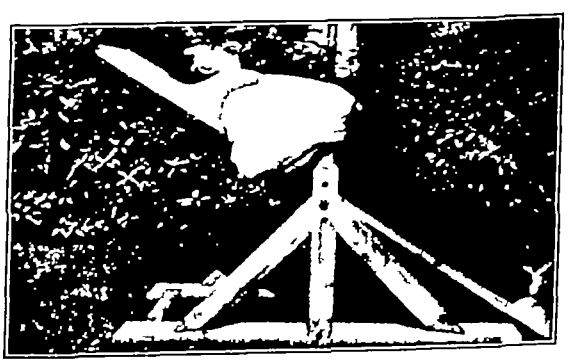

FIGURE 3

CASE OF EARLY GANGRENE DUE TO OXALIC ACID IMMERSION

By MAX GROLNICK, M D., BROOKLYN, N Y

SEVERAL months ago a painter appeared at my office with the symptoms and findings as will follow A search of the recognized texts on Dermatology and Surgery, and of numerous works on Industrial Diseases failed to reveal mention of a similar case I am therefore presenting it.

Mr J G—, single, age 23, born in Russia, by occupation a painter, sought relief for pain and tingling in the fingers of both hands with inability to use same This had come on rather suddenly during the course of his labors On questioning the patient, I learned that he had been scrubbing floors with a solution of oxalic acid This is used by painters as follows One pound of oxalic acid crystals is dissolved in one or one and a half gallons of hot water The floors are first prepared with a varnish remover, and are then scrubbed by means of a hand sponge, hand brush, or steel wool, with the hot oxalic acid solution for the purpose of bleaching the wood The hands of the painter are usually protected by rubber gloves The floors are then ready for receiving the shellac

My patient had been doing this type of work during the past two years at infrequent intervals, and for only a short period of time, in the course of his regular painting jobs However, during the two previous months he had devoted to it as much as twelve to fifteen hours a week Furthermore, he had never adopted the protection of rubber gloves On the day before his visit to my office, soon after one of the above described washings, the patient noticed a drawing pain under the nails of the fingers of both hands Later the fingers became stiff, so that he was able to flex them only with difficulty During night the pain became so severe as to cause insomnia The complaints were more marked in the right hand His past history was unimportant, excepting for an attack of articular rheumatism one year previous, which had resulted in partial ankylosis of the right elbow

Physical examination revealed a well nourished male adult, not acutely ill Pupils reacted to light and accommodation, conjunctival hemic component was good Ears, nose, and throat were negative There was no lead line Blood pressure was 122/60 Heart, lungs, and abdomen were negative

The right hand showed a deep cyanosis from the finger tips to beyond the wrist The color was not uniform, but presented a mottled appearance, with areas of lesser cyanosis The nails were yellow, exhibiting none of the normal pink hue The soft tissues of the hand, particularly the terminal phalanges, were very tense There was only slight ability to flex the fingers The hand felt cold to touch, and sensation was numbed

The left hand gave a mottled appearance of blue and pink, interspersed. The tissues were less tense, sensation was present, and moderate flexion of the fingers was possible

I felt justified in considering the case one of early gangrene, especially of the skin, due to immersion in the caustic oxalic acid solution, the effect probably being similar to that produced by continued local applications of strong phenol solutions I prescribed hot Epsom salt baths, dry heat, and woolen wrappings around the hands The patient appeared on the next day stating that the pain was nearly gone. He was able to move the fingers on the left hand freely, and had about 50% flexion in the fingers of the right hand The latter was less cyanotic, with dispersed patches of pink The color of the nails was returning The tissues were less tense, and the temperature of the skin, though still cool, was warmer than on the previous examination The left hand was now nearly normal in appearance.

Although the patient was urged to return for several follow-up visits, he never made any further appearance I later was able to reach him by telephone, when he told me that he had no discomfort, and had been working again for several days

---

THE TREATMENT OF RINGWORM INFECTIONS OF THE HANDS AND FEET*

By FRED WISE, M D, NEW YORK, N Y

SABOURAUD, speaking of ringworm infection of the hands and feet, said that the malady may be readily improved, but slowly cured I am sure that all those who have struggled with the infection in a large number of patients will agree with him in this opinion. In a review of the subject, White and Greenwood pointed out that this common affection of the extremities was known and described by Tilbury Fox as long ago as 1870, again by Pellizari in 1888, and that a comprehensive and detailed description was published by Mouktar in 1892 Since that time a great deal has been learned and published about the disease in its laboratory aspects, but on the therapeutic side, progress has been lamentably slow

* Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N Y, June 5, 1929

The difficulties encountered in attempts to cure these eruptions is reflected in the long list of remedies suggested in scores of publications It may be said at once, that the majority of them are at best unsatisfactory, and that their therapeutic action is capricious An occasional patient may do well under a certain remedy, while the next patient, with an eruption practically identical with that of the first, will either not respond at all, or his eruption might even become aggravated under the same treatment Why this class of patients are in the habit of "shopping" among dermatologists, is thus easily explained

The various remedies in common use being known to all, I deliberately refrain from dwelling on their respective merits and attempting to evaluate the different formulas and combinations which are employed with varying success by different dermatologists, but as a certain number of them have been found to be especially useful in combating ringworm eruptions on the extremities, they deserve mention at this juncture Among these are tincture of iodine, the oils of thymol, clove, cinnamon and eucalyptus, solutions of potassium permanganate, silver nitrate and picric acid, salicylic acid, benzoic acid, mercury and mercurochrome solution, resorcin, chrysarobin, pyrogallic acid, sulphur and the various preparations of tar Certain aniline dyes are also being used Eruptions in which many of these remedies fail to do good, will sometimes respond favorably to such a simple procedure as a wet dressing of diluted Burow's solution—a remedy which I frequently employ before attacking the disease with the stronger applications

This brings us to the first point in therapy which I want to emphasize namely, that the treatment of these eruptions should be the treatment of *eczema,* for we are dealing with the various clinical phases of eczema, caused by a parasitic fungus In this connection, it is well to bear in mind the clinical classification of White and Greenwood, who divided the ringworm eruptions into these varieties Macular, vesicular, macerated, hyperkeratotic, papular, and nail infections The experienced therapeutist will employ what he has learned to be the remedy of choice, depending largely upon the diverse clinical manifestations which meet his eye. For example, secondary infection with pus organisms frequently is the deciding factor in the choice of a given medicament, such as ichthyol or ammoniated mercury Whitfield's ointment, in its original strength, might act quite favorably on a circumscribed patch of fresh vesicles on the back of the hand, but of what possible use can it be for a keratoderma of the ball of the foot, consisting of a plate of armor an eighth of an inch thick? Tincture of iodine, solutions of potassium permanganate or of mercurochrome might be of considerable benefit to a macerated interdigital ringworm, but when applied to an eruption on the palms of a man whose entire day is spent in washing dishes in the rear of a restaurant, or on the hands of a woman who scrubs floors most of her waking hours, such remedies are obviously useless To carry the theme further, can we reasonably expect a stenographer in a broker's office, or a seamstress handling fine silks, or a chorus girl in the glare of the footlights, to go to work with such remedies as mercurochrome or tar ointment on her hands? In other words, it is safe to say that every case of ringworm infection of the hands and feet calls for a therapeutic approach conforming not only to the clinical aspects of the eruption as already pointed out, but also to various social and economic conditions, directly referable to the patient's status in different walks of life

The second point I want to emphasize, and a corollary to the first, is my conviction that the main reason for the difficulties encountered in the cure of these eruptions lies largely in the fact that they are not subjected to a sufficiently sustained and prolonged therapeutic attack The large majority of our patients are necessarily ambulant cases In private practice, the men must play golf and the women must play bridge. If the prescribed remedies are kept in contact with the diseased areas during six or eight hours of sleep, the patient considers his work well done. In most cases the disease is practically untreated from eight in the morning until eleven at night

I believe, therefore, that if we are to expect better and quicker results, that we should insist on continuous instead of intermittent use of our remedies In severe cases confinement to the house or to the hospital is almost an essential factor in bringing about a cure Patients in whom the infection has caused partial or complete disability are becoming more and more common, according to published reports, although in my own experience they are rare.

As to actual cures, I agree with Weidman and others that probably fifty per cent of our patients are susceptible to cure without great difficulty, and that the apparent remissions are in reality often re-infections It is quite logical to assume that many patients re-infect themselves from sources identical with the original locus of contamination, such as shoes, bed room slippers and clothing in general, golf clubs, gymnasium paraphernalia, tennis rackets, jock-straps, bathing trunks, bath-mats, the floors of bed-rooms, bath-rooms, locker-rooms, turkish baths and gymnasiums, even door knobs and street-car grips are under suspicion This partial list of possible sources of contamination leads directly to the consideration of prophylaxis, which I may dismiss, it having been thoroughly discussed by previous writers

Another most probable source of re-infection,

especially of the feet, is ringworm infection of the nails I believe, as does C M Williams, that there are many cases in which the nails to the naked eye, present hardly any deviation from the normal, but which nevertheless harbor the ringworm fungus, and from which scrapings containing the organism may often be demonstrated with less time and trouble than is required for positive specimens from the skin itself If this be true, the problem relating to prophylaxis becomes simplified in patients in whom the nails are implicated

My personal experience with most of the remedies mentioned is limited. I have obtained the best results with three of them namely, wet dressings of diluted Liquor Burowii, alcoholic solutions of salicylic acid, and ointments of chrysarobin Contrary to the experience of some of my colleagues, I find wet dressings very useful as a preliminary to the application of desquamative and reducing agents, in the large proportion of eruptions I have yet to see a case in which a wet dressing, applied for twenty-four to forty-eight hours, has acted in any way but favorably It tends to allay itching and tension, relieves congestion, softens the skin and promotes the opening and evacuation of vesicles and bullae. The Burow's solution is diluted with seven to ten parts of water, and is applied with a light gauze dressing, oiled silk or rubber dam should not be used, excepting in the dry, hyperkeratotic cases Following the wet dressing, the routine treatment consists of the application, with a small camel's hair brush, of an alcoholic solution of salicylic acid, varying in strength from twenty to thirty per cent. This solution is painted on the affected areas three times daily, and is repeated until the skin desquamates in large and solid flakes The patient seldom complains of discomfort or pain *

The next step is the application of a modification of Dreuw's chrysarobin ointment, according to the following formula Oleum rusci, 30 minims, chrysarobin, 20 to 30 grains, salicylic acid, 20 to 30 grains, soft soap and anhydrous lanolin, equal parts, q s to make one ounce This provides an ointment of chrysarobin and salicylic acid in strengths of four to six per cent If itching is severe, phenol up to two per cent and menthol up to one-half per cent may be added. In ambulant patients, the ointment is to be applied only at night, to be removed with olive oil in the morning In patients who are confined indoors, the ointment is re-applied in the morning, and left on all day Chrysarobin and salicylic acid may be used in higher proportions in selected cases, Howard Fox reported good results with ointments containing twenty per cent of chrysarobin.** In general, this mode of treatment, and the indications for its discontinuance, are practically the same as those applying to its use in patches of psoriasis

In patients with eruptions on the hands (scaling and vesicular trichophytids), to whom I have referred, who are unable to use unsightly preparations, I content myself with the use of a ten to fifteen per cent alcoholic solution of salicylic acid, to be applied three times daily This does not interfere with their work and certainly tends to keep the disease-process in abeyance Should severe inflammatory reactions supervene, recourse may again be had to the wet dressings, in other words, the logical treatment for eczema is followed through when indicated Quite recently I have been experimenting with a modification of Whitfield's ointment made up in a greaseless cream instead of a fatty base. It may be rubbed on the hands several times a day without interfering with the patient's work, and will not stain materials with which it comes in contact, not enough time has elapsed to justify an opinion as to the value of such a combination, but it might prove useful in certain cases

Whitfield's ointment is used with more or less success by many dermatologists, more especially in this country and in Great Britain I have found a modified Whitfield's ointment to be beneficial in severe and chronic eruptions and sometimes curative in the milder cases Whitfield's original formula consisted of 25 grains of benzoic acid, 15 grains of salicylic acid, 2 drams of soft paraffin, and cocoanut oil q s to make one ounce. Whitfield subsequently recommended a formula to be used during the day, consisting of 1½ drams of benzoic acid, 1 dram of salicylic acid, 1 ounce of acetone, and diluted alcohol, q s to make 4 ounces The strength of the two acids should be varied to conform to the type of eruption and the degree of inflammatory reaction I have obtained good results with a combination of 2 per cent. thymol, 6 per cent. benzoic acid and 12 per cent. salicylic acid, incorporated in a base of equal parts of lanolin and vaselin, these percentages being raised or lowered to fit the case The outstanding advantage of such combinations is that they do not cause unsightly staining of the hands

Recurrences on the feet may be prevented by the daily application of either 2 per cent solution of mercurochrome, or half-strength tincture of iodine The patient is instructed to wear paper slippers which are discarded and burned immediately after use. To prevent recurrences on the hands and at the same time to avoid excessive staining of the skin, a half-strength of Whitfield's acetone formula, cited above, should be applied three times daily Old gloves should be destroyed A mild antiseptic ointment should be

* I am indebted to Dr D L. Satenstein for his suggestions regarding the use of the salicylic acid solutions.

** Chrysarobin varies in strength depending on whether it is fresh or stale, fresh products are far more powerful.

applied to the hands every night, during a period varying from several weeks to six months

Advanced and long-standing cases of nail ringworm infections are best treated radically, that is, by avulsion of the nail under novocaine anaesthesia, followed by dressings of mild ammoniated murcury ointment In nail infections of short duration I have obtained a few cures with fractional doses of Roentgen rays, administering from six to eight one-quarter units, skin-distance doses at weekly intervals, and limiting the dosage to a total of two Holzknecht units (skin distance) over a period of eight weeks The routine treatment for the average chronic case consists of constantly applied Whitfield's ointment, the finger-tips being capped with impermeable finger-stalls of adhesive plaster These are renewed once a day The skin about the nail must be protected with adhesive plaster or collodion, to avoid maceration Cures can be effected by this mode of treatment, but the time required has varied in my experience from three months to a year

Of the many other methods used in the treatment of the hands and feet with varying degrees of success, I will mention only two the method of Glaze, who employs a strong ointment of salicylic acid to produce rapid and complete exfoliation of the affected skin, and the formulas suggested by Ruggles I have had no personal experience with Glaze's method, but some of the men at the Post Graduate Hospital Clinic tell me that they are getting good results with it. Ruggles first applies an ointment composed of zinci oxidi 60, petrolati 80, Ung picis liquidi 120, Ung aquae rosae 100, Misce et adde, phenolis 95 per cent, 10 M S Apply twice a day as directed This is used until the acute eczematous stage has subsided, to be followed by a wash composed of tincture of iodine, 60 gm, spirit of camphor, 250 gm This combination is a favorite with many dermatologists, notably White of Boston

I find it difficult to evaluate Roentgen ray treatment in these dermatoses I administer Roentgen rays in certain cases, but not with an undue amount of optimism It can be said that the rays sometimes accelerate a cure, at other times have no apparent effect, and now and then they seem to aggravate the trouble I have not as yet tried massive doses at monthly intervals In any event, Roentgen ray treatment must be administered with due caution, and only the mildest local remedies should be applied in conjunction with radiotherapy As to ultra-violet light, I have found it at times to act well as a palliative remedy *

THE PERIODIC HEALTH EXAMINATION*

By C WARD CRAMPTON, M D, NEW YORK

SEPTEMBER 20th, 1929, is an important date It marks the first meeting of the Committee on Periodic Health Examinations This Committee has been delegated by the official organization of physicians of the State, to study the Health Examination, to popularize it and to conduct a campaign among the people of the State The House of Delegates has taken an epoch-making step and we of the Committee feel that our duties are both heavy and honourable The House of Delegates in taking this important step has placed the State Society in its proper position abreast of the best leadership in the medical profession There have been various organizations, both lay and medical which have preceded the action of our Society This is as it should be Our organization should not divert itself with new and untried experiments It should assay the trend of scientific and medical progress and, after wise deliberation, act with decision, confidence and vigor representing the best counsels and combined wisdom of the medical profession of the whole State This has been done The decision is made and the way is open for progress Now we are prepared to take up our task and drive forward with power

We believe and we have evidence to support our confident faith that the Health Examination will save life, it will decrease suffering, it will postpone deterioration, it will increase health, happiness and efficiency We believe that these great and desirable benefits should be gained by every man, woman and child in the entire State We believe further, and more particularly to the present occasion, that it is the physicians of the State, the men who know about health, who know about disease and who by their daily service to the sick and suffering have gained the confidence, love and admiration of the people of the State, we believe that it is these physicians who must give this message and bring these benefits as a further pledge of their devotion, energy and wisdom

We must, however, make our calling and

* Address before the Annual Meeting of the Fourth District of the Medical Society of the State of New York by the Chairman of the Committee on Periodic Health Examinations

election sure We must know exactly what we are about It is not your Committee that will bring about this result, nor yet the House of Delegates It is the everlasting combination of the faith and works of every member of the Medical Society in every part of the State This is not a mere campaign This is the beginning of an abiding, vital conviction on the part of the medical men of the State that they have found a new way of rendering human service

It is true that this bright knowledge and burning conviction is not as yet overwhelmingly apparent in every corner of the State If it were, there would be no need of this Committee If every physician knew and had an abiding faith in the Health Examination, the citizens of the State would all be brought under examination within less time than it takes to organize a church sociable or a county fair There must be a spread of knowledge, an increase of conviction regarding the Health Examination We possess a large series of convincing facts in every department of medicine We can and will declare them to you but these facts could never be as vital and as convincing as the truth that you can establish for yourselves We want every man to know from his own experience in conducting, directing, assisting, and taking and studying the Health Examination to know what it will do We need the warm, new, vital evidence from every department in medicine and we propose to ask every special section in every department and organization of physicians in this State to prepare and to deliver facts, clear, indisputable, plain everyday four square facts concerning the efficiency and effect and value of the Health Examination

Let us be more concrete and definite The Health Examination goes over a man from top to toe, inside and out, bringing every scientific method to bear in answering the question, "Are there any signs of present and future illness?" Is there anything here or there that might cause trouble in the future? In short, are there any pre-clinical signs of illness, deterioration, disability or disease? Can we catch the first faint flicker of the shadow of death? We know that this man, like every man, must some day die We want to know, if we can, by which way and from what direction death will first stalk his prey, and we wish to strengthen the defenses where they are weak, and build bulwarks of health, strength and power to resist with serene confidence the onslaughts of time and the inevitable death

This is the task we have before us, the discovery and practice of pre-clinical medical science We ask every specialist to give his contribution The ophthalmologist must tell us of the warnings of constitutional disease that he sees in the eye He must tell us how we may recognize them Once recognized, we must devise ways to oppose the advance of destruction The specialist on the nose and throat must tell us how to recognize the signs which may be found in this region which indicate present or future illness elsewhere in the body, and he must teach us to recognize those increasing signs of danger and destruction which begin in his department that affect every portion of the body The gynecologist the urologist and the internist must give us increasingly every year more and more pre-clinical signs, more clearly defined, more definitely coupled with their pathological sequences, until we have a science of pre-clinical medicine that will be to the practice of medicine as great a power for the prevention of disease as the discovery of vaccines, antitoxin, or even the bacteria themselves

Gentlemen, the medical profession is entering upon a new epoch At first, it was called upon only to serve when the man was actually in the clutches of death Later as the intelligence of man increased, he called upon his physician earlier when he recognized serious disease or prostration had served upon its victim The next advance was to call in the physician to prevent the spread of disease from person to person and preventive medicine was born But now with the increase of foresight and intelligence of man, there is a call upon us to exercise our talent in the prevention of the earlier beginnings of disease so that the proper medical steps may be taken long before we come to the sad, irrevocable time when we approach the sick bed of a man and must give the inescapable dictum "it is too late It might have been different. If you had come to me five years ago I might have done something"

But gentlemen, it is going to be different. We are going to do something We are developing the pre-clinical phase of medicine and the Health Examination The world looks to the physician It is his duty and high privilege to take the leadership in the great new service. The Medical Society of the State of New York and its every member face that challenge

MEDICAL SOCIETY PRACTICE

The scientific department of this Journal contains articles which may properly be classed under the title of Medical Society Practice, for they deal with methods and procedures which are promoted and controlled by medical societies in distinction from individual physicians Leadership in popular medical education, for example, belongs to the County Medical Society, although the actual work of preparing articles and delivering lectures may devolve on individual doctors acting in the name of the Society The promotion of immunizations against diphtheria also belongs to the County Medical Society, although each immunizing dose is given by an individual physician to an individual patient The County Medical Society practices medicine when it sets standards of practice by the mutual agreement of its individual members The records of the practice of medicine by medical societies in New York State are becoming voluminous and are worthy of a special department in the New York State Journal of Medicine.

THE ECONOMICS OF THE PRACTICE OF PREVENTIVE MEDICINE

The medical profession is expected to give all forms of medical service to all classes of people Doctors are the producers of medical service, and the people are its users and consumers

Medical service is subject to the economic law of supply and demand The doctors can supply something of very great value to the public. The people want health and will purchase it wherever they think they can get it They will spend their money for it freely, but they are economical in their expenditure of time and effort. They demand that the doctor give them something which will act quickly while they sleep The most popular medicines are a "tonic" which will speed up their vital actions by day and a "sedative" which soothes and composes them at night Doctors always have tonics and sedatives on hand, but medical service which embraces them only is as unsatisfactory as an automobile repair service which supplies only gasoline and oil Anybody can fill his tank with tonics and sedatives, and that is the reason why quacks flourish The modern health service involves a wide knowledge of the human machinery and the ability to detect abnormalities which are hidden from the uninitiated

The range of service which the average family doctor is prepared to give has been rather narrow, and when the patient has asked him for something outside of his routine practice, the doctor has often replied "No, I am not hooked up to give that service It is just one of those new notions What do you want it for, anyhow?" The doctor is expected to supply the health service which the people need, and if he doesn't have it on hand, he will act wisely by getting it for a patient, even at a loss to himself, for a satisfied patient is the doctor's best advertisement

The practice of medicine has been expanded after the manner of all other lines of human endeavor

1 There has come the discovery of new principles and the development of standard methods of their application

2 Men have been trained and machinery installed to give the new form of service

3 The people have been educated to seek the new service and to buy it

The three principles of discovery, production and salesmanship apply to doctors as well as to manufacturers of commercial goods They are fundamental Every doctor must continually discover new methods of practice for himself by reading, observation, and experiment He must also equip his office for the production of the service which is demanded by the modern practice of medicine, and finally he must sell his service to the people by making known what he has to offer and by giving satisfaction when he delivers it

Discovery, production, and salesmanship are three fundamental activities which depend largely upon one's individual temperament. Some physicians are men of discovery and research, but are unable to deliver their service to patients Some doctors have excellent abilities as producers of medical service, but are lacking in the knowledge of science and in the ability to attract patrons Others have much ability in salesmanship and are highly successful financially even though they practice a deplorable form of medicine.

A proper balance of discovery, production, and salesmanship is necessary if a physician would be respected by both his patients and his colleagues

It is often said that the economics of the profession of medicine is different from that of all other professions, for if the doctor cured all his patients, there would be no one left to need his services Doctors today would starve if they depended upon malaria, typhus, typhoid, diphtheria, and smallpox on which doctors grew rich a half a century ago But these and similar diseases are still with us and physicians must deal with them in the field of preventive medicine. While the field of the cure of many diseases is becoming limited owing to the lessening of the number of victims, yet the field of their prevention is widening and developing at a rate which more than compensates for the loss of curative service

New discoveries and new standards create dissatisfaction and jealousy as the upholders of the old order see their prestige passing to the advocates of the new The benefits and possibilities of preventive medicine have been advertised in exaggerated forms by societies with great financial endowments The exaggerated advertisements of the benefits and possibilities of preventive medicine issued by these societies have often aroused the resentment of practicing physicians An example of an ideal impossible of attainment is the slogan "No tuberculosis in 1930" issued by the anti-tuberculosis organizations But during the fifteen years since that slogan was put forth, physicians have adopted the enthusiasm and methods first set forth by the endowed societies and have discerned and occupied the fields of tuberculosis practice first opened by them

Every new field of medical practice, like that of a new article introduced into trade, requires an outlay of both money and time before it yields financial returns A new field of medicine is always developed in three stages

1 Its practice is recognized by a few physicians who demonstrate its need and usefulness and secure the cooperation of a few of their medical brethren.

2 A group of physicians advocate the procedure before the county medical society and finally secure its endorsement of the new form of practice.

3 The county medical society takes steps to

induce all its members to enter the newer field in their private practice

The practice of preventive medicine has usually been developed by official departments of health who, as a result, have been accused of entering into competition in private practice But the departments of health of the State and City of New York are now taking the attitude that the government will abandon any field of medicine in which the family physicians are giving efficient service The departments of health are abandoning their attitude of competition with private practitioners, and are becoming feeders of the doctors' practice

The development of the practice of preventive medicine by family physicians has been slow owing largely to the lack of a system of patents which will protect them in their new discoveries, but the absence of patents is more than compensated by the system of advertising introduced by lay health organizations whose peculiar field is public health education The people's demand for the practice of preventive medicine develops in three stages

1 Demonstration by an endowed organization
2 Adoption by departments of health
3 The demand for it by the people generally

This development of preventive medicine is permeated with an economic element The preventive service is often free during the initial stage, in order that the value of the method may be demonstrated and its standards developed The service is continued free while its demonstration is carried on by departments of health in order to popularize it Only when the people feel their need for the service and come to the doctor demanding it, will the physician receive a direct benefit from the practice of preventive medicine

Physicians are fortunate in that lay health organizations have advertised the practice of preventive medicine and prepared the field for its occupation by private practitioners who will receive economic profit from its practice

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Fees from the Rich The legality of charging the rich more than the poor was discussed in this Journal of December, 1904, in the following article copied from the *New York City Law Journal* of October 19, 1904

"Some of the medical journals have been complaining of a recent decision by a judge in St Louis to the effect that a physician is not entitled to charge for medical services in proportion to the wealth of his patient We have not seen the decision, and know of it only through journalistic reports and criticisms If, however, the substance of the judge's action is correctly stated he certainly correctly administered the law In a comparatively recent case in our own State (Platt v Hollands, 85 App Div, 231), it was held that a man of large wealth may not be required to pay more liberally for the services of a housekeeper, nurse, secretary and companion than a poor man On this ground the following extract from the charge to the jury was held erroneous

"'And you have a right to take into consideration in measuring these damages (services) the circumstances of the deceased, that is, the amount of property which he owned, his financial condition, because a man having large financial interests, banking interest, real estate, tenement houses and mortgages, should pay more reasonably and liberally for services of this kind than a poorer person would You have a right to take into consideration those facts in making up your minds how much money she is entitled to, if she is entitled to anything'

"In certain classes of actions for damages evidence of the general financial ability of the defendant is competent In actions for breach of promise of marriage such evidence is admitted, because it bears upon the question of the manner of living and position in society which the plaintiff would have enjoyed if the defendant had fulfilled his contract So, also, evidence of the reputed wealth of defendants may be admissible on the question of punitive damages in order to determine the proper amount thereof to be awarded (Sedgwick on Damages, vol 1, section 385, 8th ed, Tucker v Winders, 41 S E, 8, and cases cited)"

The writer continues

"With regard to actions for services, however, proof of a defendant's wealth is clearly illogical and calculated to mislead a jury, unless the quality of the services was characterized by the nature and value of property"

MEDICAL PROGRESS

Lymph-Stasis the Precursor of Cancer—W Sampson Handley states that if the theory of the evolution of the primitive unicellular individual to the multicellular organism is true, each cell of a higher animal is descended from a one-celled organism with an irresistible appetite for food and multiplication These are the appetites which dominate the cancer cell and suggest that cancer is an atavistic reversion of certain cells to their primitive state The reversion is probably conditioned by disordered bodily function, that is, the body has failed to carry out the contract under which the cell abandoned its right to unlimited multiplication Under the contract each cell has a right to its share of the products of all other cells of the body and to protection from external irritation Cancer is intimately associated with local obstruction of the lymph vessels, but the obstruction must be of long standing, twenty to thirty years The lymphatic obstruction may manifest itself only by papillary hypertrophy and increased cellularity of the subepithelial connective tissues This obstruction will profoundly influence the conditions under which the cell lives, the intercellular pressure will be raised, wandering cells may be trapped and be unable to leave the district, the supply of oxygen will be restricted and the fluid bathing the cells will be relatively stagnant, lacking the supply of fresh hormones from other cells, especially the inhibitory hormone which is the sedative to the cell's primal passion for division Experimental studies of tar cancer show that the connective tissue is not indifferent to the irritation of tar, and tar causes cancer by producing lymphatic obstruction with papillary hypertrophy It has long been known that the evolution of papilloma into carcinoma is not rare, but the closeness of the relation has only recently been realized It seems that carcinoma is invariably preceded by a definite papilloma or by a local area of papillary hypertrophy This holds for cancer in various regions of the body, but in only one variety has Handley been able to trace with absolute clearness all the stages from the initial obstruction to fully developed carcinoma, namely in tuberculous lupus, especially of the erythematous type. The findings suggest that multiple papillomatosis of the large intestine and of the bladder is really a product of abortive local tuberculous infection in early life, as well as a precursor of cancer Handley also presents a detailed study of the process of lymph stasis in elephantiasis, and reaches the conclusion that any pathological process which gives rise to lymphatic obstruction may be a cause of cancer—*British Medical Journal,* October 5, 1929, ii, 3587

The Resistance to Malignant Growth.—After reviewing the evidence for regarding the growth of cancer as of fundamentally the same nature as growth of any other kind, Trevor Heaton points out that in normal growth tissues which fail to increase, though their cells proliferate, must be subject to some form of restraint This process has been described as tissue tension, that is, tissues in contact with one another maintain a certain equilibrium in spite of tendencies to expand Any tissue whose cells are constantly multiplying will expand to the limit of available food supply, and tissue tension must involve the restriction of this supply The needs of tissues include nutrition, oxygen, mechanical support, and the removal of waste products, so long as these services are stationary, all tissues dependent on them will be stationary also The stimulus of epithelial activity tends to upset the equilibrium, but is only in special circumstances sufficient actually to do so. The influence which antagonizes the stimulant action of epithelia is external—probably a hormone or vitamin In an attempt to determine the nature of the inhibiting influence, Heaton made extracts of various organs and tissues and freed them from proteins and growth-promoting factors All the tissues investigated showed a growth-inhibiting action in approximately the same degree, except liver extract which was rather more active than extract of other organs The addition of the extract of any tissue prevented the growth of fibroblasts without interfering with that of epithelia It seemed that the growth-inhibiting factor was derived from the diet It was found in brewer's yeast but not in baker's yeast Extract of malt, when administered to animals in small doses, delayed growth, in larger doses growth was arrested, and when the treatment was omitted growth was resumed The inhibition of growth could not be attributed to the toxic effect of the extract, for the younger the animals the less easily were they affected, and in guinea-pigs a curve was obtained showing a definite inverse ratio between the body weight and the dose per kilo necessary to arrest growth In Jansen rat sarcoma and in rat carcinoma No 9, the extract given intraperitoneally resulted in the tumor growth being

brought rapidly to a standstill, but the necessary dose was large, and after the growth was arrested the animals usually died This, however, was thought to be due to the method of administering the extract, for when the rats could be induced to take it by mouth, complete regression was obtained —*The Lancet,* October 12, 1929 ccxvii, 5537

The Relation of Biochemistry to Cancer — William J Mayo, writing in the *Annals of Surgery,* November, 1929, xc, 5, reviews the newer conceptions of physics and chemistry based on the theory of the electron, the proton, and the photon, which has to do directly with our understanding of the ultraviolet rays and the vitamins, and discusses the ways in which these are concerned with the chemical exchanges of the body He traces the influences of metabolism of the elements, such as sulphur, copper, iron, and arsenic, and the metabolism of proteins, carbohydrates, and fats, showing that the oxidation of carbon and hydrogen is the outstanding feature of all animal life Uncontrolled combustion of food material is the most important feature of the growth of cancer It is therefore worth while to consider how combustion is controlled The best explanation at present is that oxidation is carried on by catalysts or enzymes In the malignant cell both the nucleus and the nucleolus are enlarged, and this is evidently due to an excess of the normal activating enzyme or oxidizing agent which controls combustion Recent researches of McDonald appear to show that persons whose reactions are toward the acid side do not often have cancer, as compared with persons whose reactions are toward the alkaline state It is only recently that these phenomena of a biochemical nature have assumed importance in the study of the cause and prevention of cancer Cancer never develops in sound tissues Chronic irritation, by opening an atrium for the possible entrance of microorganisms to the body, seems to suggest an external agent, but does not explain why cancer develops in some cases in which there has been very slight chronic irritation and does not develop in others in which chronic irritation has been extensive and prolonged It is difficult to surmount the fact that when cancer metastasizes to a new situation, it produces the histopathological picture of the tissues in which it originated Evidently, the agents which act on the cell to produce malignancy become an integral part of the cell itself The factor of supreme importance which has not been sufficiently stressed is that individuals vary in their susceptibility to the cause or causes of cancer In no other way can we explain why 90 per cent of persons do not have cancer and 10 per cent die from it It is as logical to accept the hypothesis that 90 per cent of persons have greater resistance to cancer than the remaining 10 per cent, as to attempt to force an explanation that only 10 per cent come in contact with hypothetical causative agents If suspectibility is the important factor, the situation of the growth must be determined by the organ or tissue subjected to the insult of the precancerous lesion, and the grade of malignancy by the susceptibility of the body as a whole Recent studies, to which the author refers, indicate that the possibility of increasing resistance to cancer in the more susceptible individuals is the goal that must be reached

Transmission of Poliomyelitis to the Monkey by the Intestinal Route.—C Kling, C Levaditi, and P Lepine report the result of some experimental work as follows Certain epidemiological experiences in epidemics of infantile paralysis have pointed to the possibility of transmission by drinking water and milk The subject is an old one and was agitated as far back as 1909, when Leiner and Weisner appeared to show that this mode of transmission was possible Later research in the Pasteur Institute, Paris, resulted negatively, but the present authors are not satisfied that the subject is closed and have resumed work on a species of simian known to be peculiarly susceptible to the virus of the disease The *Macacus cynomologus* having been infected with the virus, an emulsion of its cord was introduced into the stomach of others of the species and also ingested in the drinking water Monkeys of the cynomologus species were infected, while control experiments with the *Macacus rhesus* monkeys resulted negatively The experiments were varied by introducing the virus into an intestinal loop and here the *Macacus rhesus* was also infected, the virus evidently entering the blood through the mesenteric lymphnodes which were swollen and which also, like the cord, furnished a virulent emulsion Another series of experiments along the same line seemed to show that water rendered virulent in this manner retained its virulence for many weeks The difference in susceptibility in these lower simians of near relationship suggests that a similar difference may exist in human beings It is stated by the authors that Aycock of Harvard independently arrived at a similar conclusion, at least one small epidemic in the United States having been shown to be milk borne, to say nothing of other episodes in Great Britain and Continental Europe. —*Bulletin de l'Académie de Médecine,* October 8, 1929

Gastritis —G von Bergmann writes briefly on what he terms the problem of gastritis, with the following conclusions The subject is one

which with the passage of years has undergone much variation of viewpoint We are now in the midst of an intensive study of the subject along new lines and it is still too soon to attempt to lay down generalizations We know that chronic gastritis is extremely common, that it may last for years without achylia. There are both diffuse and focal (antral) types In classification we must honor morphological and secretory alterations and must abandon to some extent the sharp distinction between acute and chronic, for the simple reason that in the chronic case we note the presence of frequent acute exacerbations which are somehow related to regenerative and reparative efforts This chronic exacerbating gastritis is a frequent concomitant of ulcer, of gallstone disease and hepatic affections, and indeed plays a prominent role in their genesis In the absence of actual ulcer the exacerbation of gastritis may simulate its syndrome In gastritis we often accuse ingesta when the eliciting factor comes from within, from the blood stream The gastritis seen in acute infectious diseases may have this origin In other cases we may accuse the formation of foreign protein from the decomposition of substances originally homologous with the system We shall have to revise broadly our original conceptions of indigestion, spoiled stomach, and the like Inability to digest certain substances may be an effect and not due to the quality of the ingesta In speaking of the causes of latent gastritis the author enumerates phthisis without any comment, but it is of interest to recall that certain Swiss physicians accuse tuberculosis of the quiescent or latent type as a frequent cause of gastric upsets, and regard causeless gastritis as a definite forerunner of pulmonary tuberculosis The severe gastric symptoms in many cases of active tuberculosis should also be thought of in this connection —*Deutsche medizinische Wochenschrift,* October 18, 1929

Recovery from Diphtheria in Untreated Cases—F Hamburger and J Siegl devote a brief paper to this subject. Some years ago, in two cases of mild diphtheria in which no serum was given, one reacted positively to the Schick test after recovery, or, in other words, Nature seems to have manufactured no antitoxin, yet recovery took place With attention once directed to this subject they followed up other cases which were too mild for serum and now have a material of 20 cases of the disease, 15 of which were Schick-positive after recovery These were followed up from 4 to 23 months and the majority remained positive while one case which changed to negative returned to positive Blood tests showed that diphtheria toxin was still in the blood and this was confirmed by animal inoculation In other words there was no formation of antitoxin as a response to the presence of this foreign substance in the blood The presence of the toxin naturally suggests that these subjects have foci somewhere in the body—the tonsils or nasal chambers presumably—which contain virulent diphtheria bacilli, and that they are a menace to the community Such patients, therefore, constitute one type of the diphtheria carrier There is an opposite group containing those who are known to have antitoxin in the blood yet are not protected against a superinfection Such exceptions seem to point out that antitoxin is not the only antisubstance which forms in the blood in response to the entrance of the toxin and that in a small percentage it does not form at all, which can only mean that other antibodies of importance exist and that we cannot speak of absolute immunization until all such substances are isolated The few who cannot form antitoxin evidently are protected by some other substance. Possibly at some future time we shall have a new classification of diphtheria immunes —*Münchener medizinische Wochenschrift,* September 13, 1929

Analogies in the Treatment of Tuberculosis and that of Rickets—Professor G von Bergmann writes briefly on this subject and first outlines the new treatment of rickets with special reference to ultraviolet light, substances containing vitamin D, and especially irradiated ergosterin He also mentions the older treatment with cod-liver oil and the minerals calcium and phosphorus He points out something not originally suspected but now realized, namely, that this treatment may involve overdosage It is, of course, known to all that cod-liver oil and other substances containing vitamin D, as well as calcium phosphate and ultraviolet light, have also been extensively employed in tuberculosis In the new dietetic treatment of tuberculosis, particularly the surgical forms, cod-liver oil is included in the regimen and the author believes that this substance or irradiated ergosterin might prove to be the essential constituent The diet as carried out by Gerson, Sauerbruch, and others is poor in mineral matter and in carbohydrates and has the double effect of antagonizing water retention and promoting mineral metabolism, and hence should act especially on the cutaneous and osseous systems The ergosterin which is present in cod-liver oil and other fats is believed by some to be the factor which affects mineral metabolism At present the solar treatment of local tuberculosis is much in vogue and the analogies between the treatment of tuberculosis and that of rickets in this respect are very impressive. But it is not sur-

prising today to read that some tuberculous subjects appear to have been made worse by the very treatment which has benefited others, for here again is seen an analogy with the treatment of rickets In such cases the possibility of overdosage must be borne in mind But despite the great similarity in treatment the author makes no effort to determine an analogy of any kind between the two diseases, nor is a rachitic child unduly subject to tuberculosis in later life.—*Deutsche medizinische Wochenschrift,* August 23, 1929

Clinical Significance of Immunity to Tuberculosis—Professor H Selter of the Bonn Hygienic Institute refers to the recent plethora of articles on this subject although there are authors who deny the existence of such a condition Kalbfleisch, for example, states that there is no room for it in modern pathology It is evident that we must overhaul our data on this subject and give a new definition of what we imply by immunity The conception seems to imply that of tuberculous supersensitiveness or allergy, for if a person is free from the latter we may perhaps call him immune Much depends upon the extent to which we may apply animal experiment to human pathology When a primary focus of tuberculosis heals, immunity must be at its maximum, but thereafter the immunity is subject to many fluctuations, and if there is generalization of the disease we may infer that it is forfeited But under these conditions the patient becomes vulnerable to external infection as well, so that two factors must be considered side by side However, the author, who has inoculated subjects with consumption with bacilli from without in the attempt to secure immunity, is unable to note any evidence of superinfection although several hundred patients were tested These were evidently able to render harmless the bacilli introduced from without The author is convinced that the immunity involved was not due to the inoculations although the opposite view was prevalent at the time He does not believe that immunity may be gained or restored by any use of tuberculin or bacillary cultures, this result can be reached, if at all, by general hygiene, rest, physical therapy, etc The paper was probably written before the assumed discovery that a special salt free diet poor in carbohydrates, can strengthen the immunity not only in surgical, but in pulmonary tubercle—*Munchener medizinische Wochenschrift,* September 6, 1929

Prognosis in Acute Abdominal Disease—Zachary Cope, writing in *The Practitioner,* October, 1929, cxxiii, 6, emphasizes the uncertainty of prognosis in acute abdominal disease, and says that prognosis should always be given with slight and spoken reservation The very young and the aged stand a short operation well, but they do not tolerate prolonged intra-abdominal manipulation General constitutional debility, complicating disease, the duration of symptoms and the extent to which the pathological process has progressed are important prognostic factors In the various kinds of intestinal obstruction and in perforative lesions of the viscera every hour adds considerably, and every hour from the twelfth onward adds very greatly to the risk. Preoperative and postoperative care must be taken into consideration Apart from intra-abdominal hemorrhage and the perforation of a gastric ulcer, there are few cases that are not improved by waiting an hour or two while saline solution is given per rectum In cases of severe hemorrhage and late peritonitis the chances of recovery are greatly improved if a blood transfusion is given immediately before or during the operation Good postoperative nursing is of incalculable value to a seriously sick patient Saline solution should be given and sleep and rest secured It is highly important that any bad symptoms be reported to the surgeon immediately The nature of the anesthetic exerts a great influence on the prospect of recovery Chloroform should not be used in toxic and infective conditions, gas and oxygen and local anesthesia should be used more frequently in shocked patients The mortality from appendicitis does not diminish as it should, and late diagnosis is still a common drawback As a general rule, it is wise to operate as soon as convenient after the diagnosis has been made, although there are cases in which it is better to wait. As to the method of distinguishing the one class from the other, Cope lays down no hard and fast rules When peritonitis is generalized and the toxemia is extreme, the slightest operative interference is perilous Some lives might be saved by delaying long enough to administer saline and acute gas gangrene serum After twenty-four to forty-eight hours the minimal operation of draining the peritoneal cavity under local anesthesia can be carried out and treatment continued after the Oschner plan In these cases free opening of the abdomen is most unwise In acute cholecystitis, without gangrene or pertonitis, the prognosis is good, but if there is cholangitis and the patient is exhausted, the prospects are much worse In biliary peritonitis and acute pancreatitis the prognosis is bad, the mortality being in the neighborhood of 50 per cent Since a favorable prognosis depends as much on recognition of early disease in the abdomen as upon anything, medical men should cultivate that priceless possession—clinical acumen.

LEGAL

By Lloyd Paul Stryker, Esq
Counsel, Medical Society of the State of New York

THE COUNTRY DOCTOR

The world owes a debt to the country doctor which it can never repay Struggling against almost insurmountable obstacles, battling with ignorance and prejudice, without hope of financial gain, the country doctor carries on in a manner that should be an inspiration to men in all walks of life. In our trips throughout the state, your counsel has been impressed with the ability, courage and devotion of the country doctor Many times we have said to these men, located in the remote rural districts, "Doctor, what keeps you here?", and often they would reply somewhat wistfully, "My people, I cannot leave them"

We wish that we could place in the hands of those within and without the profession two articles that we recently read in the *Journal of the Missouri Medical Association* dealing with the country doctor His life is thus graphically described

"Let us take the country doctor To this day he very often must be his own nurse, druggist and chauffeur The roads over which he must make his daily and nightly march over the great enemy of all mankind are still, very often, topographically a No Man's Land In winter he must take to horse, and the horse frequently quits before he does Then he sets off along roads and through fields drifted deep, and when his feet grow numb he removes his shoes to the bite of the raw snow In late August and September, at Christmas time and in the 'baby' season he miraculously contrives to live without sleep Sometimes he gets paid—after the harvest or when a load of stock brings in enough to satisfy other creditors first He has no time to be ill himself He fights his lonely battle—hopelessly, for there will be sickness and death long after these dread allies have laid him away—until his constitution is hollow and brittle as last fall's wheat stubble In twenty years or forty he is through In his old age he and his family have for comfort and subsistence many books filled with letters and figures recording many long rides over the hills, many victorious fights against the enemy, many dollars which those rides and those fights should have brought but did not bring him and his family"

And we wish also that those in the rural districts who are inclined to call a physician on the slightest provocation without reference to whether he is really needed and with no thought of really compensating him, would read an article entitled "A Midnight Call" from the same Journal It reads in part

"The telephone rings at midnight and a sleepy voice answers 'All right' Then the patient wife hears the grumbling doctor as he hurries into his clothes and galoshes, a door slams and the neighbors hear a rattle of chains, a muttered cuss word, the whir of a starter and the protesting sputter of a cold motor, then a Ford roars out into the night over roads as slippery as the streets of Jerusalem were when Balaam passed that way, and the doctor is off on a night call

"But the old doctor grins and goes on for he knows he is not going to meet any of the chiropractors on their knees in a mud hole at midnight invoking the aid of Jehovah as he tries to wrap a chain around a mud caked casing Under these conditions it is not surprising that the hard cussing, and hard headed old country doctor often develops a homely philosophy of life that is shocking to the missionary society and causes his pastor to spend many sleepless hours in prayer for the salvation of his soul"

The pictures here drawn are not exaggerated, as any country doctor can testify How petty seem our troubles, and how petty too the small sacrifices that we may make, when we compare our lives with that of the country doctor

---

POTT'S FRACTURE—CLAIMED NEGLIGENCE IN REDUCTION

In this case the doctor was called to the home of a woman, who gave him a history of having fallen from a chair in her place of employment during the day, and that she was taken to a hospital, but refused treatment She also told the doctor that an *x*-ray had been taken at the hospital. This *x*-ray was later examined by the doctor An examination disclosed the ankle in splints These the doctor removed and found the ankle very much swollen with crepitus in both bones of the ankle, there was a deformity and loss of function The deformity was an external and posterior displacement of the foot above the ankle. The doctor made a diagnosis of a Pott's fracture The ankle was so badly swollen that the doctor put it in splints and waited a few days

for the swelling to go down before setting it and putting on a cast The doctor advised the patient to permit him to treat her in a hospital, as he told her in that way better results would probably be obtained, but the patient refused to accede to his request

During the next five days the doctor saw the patient twice, at which times he would remove the bandage and make a manual examination and manipulation During this time there was a decrease of the swelling, and at the end of five days the doctor was of the opinion that the ankle was ready to be set and a cast put on On the fifth day, under a general anesthetic, the foot was manipulated, the fracture reduced and put up with the toes elevated and a circular cast was then applied as far up as the knee An *x*-ray picture was taken a few days thereafter showing a good reduction, a good weight-bearing line and good alignment of the fracture. The doctor saw the patient every two or three days for a period of three weeks, during which time there were no complications

After the expiration of three weeks the cast was cut down and a manual examination disclosed the bones in good apposition The doctor replaced the cast and left it on for two weeks longer, and then cut down the cast and ordered massage When the cast was cut down at the expiration of five weeks, there was good union and no deformity The patient complained of some pain about the instep and the doctor suggested an inner sole steel plate in the arch The patient expressed herself as being perfectly satisfied with the result and returned to work

Subsequently the patient brought an action charging that the defendant had negligently set the fracture causing a deformity of the leg and ankle, and impeding locomotion

The plaintiff, however, failed to proceed with the action and on our motion the same was dismissed, thus terminating it in the doctor's favor

---

NEEDLE CLAIMED TO HAVE BEEN LEFT IN BODY DURING SURGICAL OPERATION

In this case it was claimed that the defendant during the performance of a surgical operation negligently left a needle in the body of the plaintiff, a woman, as a result of which she claimed to have been damaged in the sum of $25,000

It appeared that the plaintiff was referred by a physician to the defendant The complaint at that time was pain in the right kidney region, referred to the pelvis, right hip and inner side of right thigh and frequent painful urination She gave a history of having had this condition existing for a period of eight years, at which time she had an infection of the pelvis following childbirth She was an extremly nervous type of woman An abdominal examination showed tenderness over the right kidney, tenderness over the lower abdomen and right hip, pelvic examination showed a marked retroversion of uterus and an enlarged right ovary, with some inflammation of the cervix The defendant called a urologist in consultation and a cystoscopic examination was made, revealing nothing abnormal in the bladder, good kidney function on either side, with some dilation of the right ureter The situation was explained to the woman and her husband, and they were advised that an operation might improve her condition, but no promise was made by the defendant that it would. The plaintiff and her husband consented to an operation Just previous to the operation, a cystoscopic examination was made by the urologist called in consultation by the defendant and he passed a catheter in each ureter which were allowed to remain in place during the operation Gas ether anaesthesia was administered and a low mid line incision was made. The position of the uterus was corrected by a Gilliam operation The cystic portion of the right ovary was removed The appendix showed signs of chronic inflammation and was removed The only time a straight needle was used was in placing a purse string suture about the appendix stump

The woman remained in the hospital for about three weeks and was discharged feeling somewhat improved About eight weeks about her return from the hospital the defendant was called to see her and she complained of the same conditions as those which obtained before operation *X*-ray pictures of the parts involved taken subsequently by other physicians did not show the presence of a needle At this last call the plaintiff became very abusive and the defendant did not see or treat her again.

After suit was begun and the case placed on the trial calendar, the plaintiff's attorneys adjourned the case from time to time and finally discontinued it, thus terminating the action in the doctor's favor

NEWS NOTES

FRANKLIN COUNTY

The regular annual meeting of the Medical Society of the County of Franklin was held at the Hotel Flanagan, Malone, N Y, October 30, 1929 Dinner was served at 1 p m A business session was opened at 2 p.m

Members present at the business session

P F Dolphin, M D, President in the Chair

G F Zimmerman, M D, Secretary-Treasurer

F F Finney, M D, and R G Perkins, M D, Censors

Drs Blackett, de Grandpre, Duerschner, Harwood, Kingston, Leetch, Kissane, Haskins, McCarthy, Packard, Sprague, Stoughton, Stickney, Tobin, Trudeau, Wardner, Stamatiades, White and Van Dyke

Visiting Doctors James N Vander Veer, M D, Albany, President, Medical Society State of New York.

Stanley W Sayer, M.D, District State Health Officer, Gouverneur

Lyman G Barton, M D, Plattsburg

John H Gutchous, Saranac Lake

The following officers were elected for the coming year

President E S Welles, M D, Saranac Lake.

Vice-President P E Stamatiades, M D, Brushton.

Secretary-Treasurer G F Zimmerman, M D, Malone.

Censor for three years C C deGrandpre, M D, Tupper Lake.

Delegate to the New York State Medical Society meeting in 1930, C C Trembly, M D, Saranac Lake, and Dr J E White of Malone alternate.

It was regularly moved, seconded and carried that the following resolution be adopted

Resolved, That at the annual meeting of the medical Society of the County of Franklin, the society and the individual members unanimously advocate the election of Dr Frank C Madill of Ogdensburg, New York, as a member of the Board of Regents of New York State, and pledge themselves individually and collectively to do all in their power to further his election

At the scientific session the following program was presented

1 A clinical case of acromegaly was presented by Drs H W Stoughton and L P Sprague This case presented some unique features and was followed by an interesting discussion by Dr Vander Veer

2 Paper "Office Prenatal Care," by Dr Paige E Thornhill of Watertown This paper was illustrated by motion pictures, and proved exceedingly interesting and helpful Paper was discussed by Drs Dolphin and Perkins, and Dr Thornhill was called upon to answer many questions on his subject

3 Paper "Modern Trend in Surgical Treatment of Pulmonary Tuberculosis" As Dr Welles was unable to be present his paper was presented by Dr H W Leetch of Saranac Lake. Dr Leetch presented a very lucid and interesting description of the modern use, indications, and results of thoracoplasty and phrenicotomy in the treatment of pulmonary tuberculosis

4 Address Dr James N Vander Veer, President of the Medical Society of the State of New York Dr Vander Veer addressed the meeting on the aims and activities of the State Society In the course of his very inspiring address the doctor stressed, among others, the following points as worthy of our deepest consideration·

Periodic Health Examination This is a field which physicians can cultivate with great profit to themselves and their patients

Preventive Medicine. Much of this work which is being done by nurses and lay agencies rightfully belongs to the physician as a source of income, and by systematic effort could in large measure be diverted to himself

Medical and Surgical Services The doctor is entitled to remuneration commensurate with his services and he should display no hesitancy in demanding same.

Dr Vander Veer discussed the provision made by the State Society for malpractice insurance, and urged all physicians to avail themselves of the same

In conclusion he impressed upon our local society the importance of holding frequent meetings, of availing ourselves of the Post-Graduate Courses of lectures to which we are entitled, and of keeping in touch with the activities of the State Society through the columns of the Journal

G F ZIMMERMAN, *Secretary*

JEFFERSON COUNTY

The September meeting of the Medical Society of Jefferson County was in the form of an outing held at the Carlowden Country Club September 12th A golf tournament was held and no business transacted There were twelve members present

The October meeting of the Society was held at the Black River Valley Club Dr Carpenter, bacteriologist of the Albany Medical School, was the speaker of the evening and his address was most instructive and interesting There was a good attendance, thirty-five members being present. WALTER S ATKINSON, *Secretary*

NIAGARA COUNTY

The annual meeting of the Medical Society of the County of Niagara was held Tuesday evening, November 12th, at the Tuscarora Club of Lockport, N Y

The Secretary read his annual report showing that the Society now has one hundred members in good standing, which is a gain of eight members over the same meeting for last year We have only lost three members from non-payment of dues, two of whom will probably return, and one of whom for physical reasons was extended an honorary membership later in the meeting

The treasurer has collected over $1,570, during the year, and has a balance on hand of over $887 The financial saving for the present year has been approximately $120 This in a total dues of $15, ten of which go to the state

The society has met six times during the year and has heard the following speakers

Dr John A Oille of Toronto on "Rheumatic Fever and Endocarditis" This was the best attended meeting of the year, over seventy-five being present Dr Marshall Clinton of Buffalo on "Some Phases of Gall Bladder Surgery" At this meeting the attendance was about sixty Dr Ezra Bridge, Superintendent of the Iola Sanitarium of Rochester, N Y on "Phrenectomy" Dr Arthur N Aiken of the Niagara County Sanitarium of Lockport, on "Childhood Tuberculosis," and Dr H F Gammon of Niagara County Sanitarium of Lockport, on "Discovering Tuberculosis"

This meeting was held at the Sanitarium in the afternoon and evening and was very well attended For this meeting we were the guests of the Board of Managers of the Sanitarium and were welcomed by the then President, Dr Frederick J Schnell of North Tonawanda

Our fourth meeting was held at the Niagara Falls Memorial Hospital as the guests of the Management At the meeting Dr Thomas J McBlain of Niagara Falls spoke on "Hernia" using the Eastman's Technical Films on Hernia as a background for his talk

Dr N I Arden of Niagara Falls also spoke on "Compensation Hernia", this with Davis and Gicks pictures on "Sutures Preparation" made a very complete program This meeting drew a very large attendance of our own men, and, with the training school of the Hospital who both attended the meeting and served lunch after the meeting, made an audience worthy of both papers

Dr H G Matzinger of Buffalo spoke to the September meeting on "Causes of Insanity" At this meeting the organization returned the compliment to the Memorial Hospital at Niagara Falls by inviting the Training School as their guests to hear this paper

At our annual meeting Dr John L Bishop of Niagara Falls gave a very practical, right-to-the-point talk on "Intersusseption," in which he urged greater care in not overlooking this important condition

The Society has lost two members by death during the year Dr Charles L Preisch of Lockport who had been an active member for years and had served the society for seven years, Dr Allan N Moore of Lockport who had been an active member of the society from 1881 until 1929

After the reading of the annual report many complimentary remarks were extended to the officers for the excellent condition of the society, both as to membership, finance, and interest

Dr R H Sherwood spoke, giving a report on the reception of the Society's Resolution which he presented to the Eighth District Branch This resolution was recently published in the Journal and in substance recommends to the proper authorities that in the application of the new Public Health Law the family physician be appointed to take care of their families when medical aid is necessary Dr Sherwood in speaking on the subject reminded us that if the society were able to obtain the interpretation of the law that it wished, it would soon have to deal with appropriating bodies of cities and counties, and that in such dealings with the business heads of the various political bodies of the states, it behooves every County Society to begin working on appropriate fee schedules acceptable to both parties

In order to make an official arrangement for officers traveling on County Society business, it was moved, seconded and carried that "The Pay of Delegates from this Society to the annual meeting of the State of New York, or to any special meeting, shall not exceed the prevailing round trip railroad fare from the delegate's place of

residence, plus charges for Pullman service, when such service is necessary, also the further total sum of ten dollars in lieu of per diem expenses"

Resolutions concerning the death of Dr Allan Nathaniel Moore were shown the Society in their printed form and ordered sent to his family Dr Moore was one of the oldest members of the profession in Niagara County, having practiced here from 1881 until 1929 The first meeting of the Society that he attended was on January 4, 1881

A communication was received from the State Committee on Periodic Health Examination and referred to our Committee on Medical Economics with instructions to communicate with the State Committee, and aid this committeee whenever possible

The Society endorsed the project of the Board of Managers of the Niagara County Tubercular Sanitarium to replace the old buildings of the sanitarium, at present used for children, with new modern buildings

The following officers were elected for 1930

President George L Miller, Niagara Falls
Vice-President Frank A Walder, Lockport
Secretary W Roger Scott, Niagara Falls

Following the paper the Society adjourned to enjoy a hot lunch

GEORGE L MILLER, *Secretary*

SARATOGA COUNTY

The Annual Meeting of The Saratoga County Medical Society was held at Saratoga Springs, N Y, on Nov 6 1929

The program started with a clinical conference at The Saratoga Hospital which lasted from 2 P M to 6 P M

At six o'clock a luncheon was served at the Y M C A at Saratoga Springs

Following the luncheon, the business program was taken up

Reading of minutes of the last meeting was omitted on motion

The Treasurer's report was read and accepted

The Report of Public Health Committee was accepted

A motion was made and seconded that the Public Health Committee appear before the Board of Supervisors in relation to the appropriation for Public Health in Saratoga County This motion was amended to read that each member of the society be notified of meeting, time to be set by Dr MacElroy, in order that the whole society may appear before the Board of Supervisors relative to the appropriation for health work in Saratoga County

Motion made and seconded that Dr Wm S Donnelly be made an honorary member of the Society and that his dues in Society be suspended. Carried

Motion made and seconded that we send a night letter to Dr E J Callahan, also to send flowers Carried

Motion made and seconded that Public Health Committee investigate the bill (Welfare) as relates to state paying doctors in the county for holding clinics Carried

Report of Committee on Milk Supervision was read and accepted

The following officers were elected

President Dr Wm H Ordway, Mt McGregor
Vice-President Dr E J Callahan, Schuylerville
Secretary Dr Harry L Loop, Saratoga Springs
Treasurer Dr John Mabey, Mechanicville
Delegate to State Society Dr G Scott Towne
Alternate Delegate Dr John R MacElroy
Censors, Dr Geo H Fish, Dr Frank F Gow, and Dr Earl H. King

The application of Israel Rubin of Ballston Spa, N Y, having been received and passed by the censors, he was elected to membership

The communication from Dr C Ward Crampton, relative to Periodic Health examination, was received, read, and ordered filed

Communication from Dr James VanderVeer, relative to nominating Dr Madill of Ogdensburg, to fill place of Regent Walter Kellogg, resigned, was received and read

A motion was made and seconded that we endorse nomination of Dr Grant C Madill to fill place of Walter Kellogg, resigned Carried The Secretary was instructed to convey information of this motion to Senator and Assemblyman of this district

A communication from Dr James E Sadlier, relative to the County Medical Survey, was received and referred to the Chairman of Public Health Committee.

Motion made and seconded that the president be empowered to appoint a committee to be known as program committee to help the president to arrange meetings

Meeting adjourned

RALPH B POST, *Secretary*

THE DAILY PRESS

INDIAN SUMMER

October is the most beautiful month for scenery While other months color the hills and the water with grays and shades of green, October paints them with the hues of lurid red and orange Seldom have the maples of the lowlands, and the oaks and hickories of the hills, shown a greater density and riot of color than during this fall, for the absence of storms and high winds has permitted the leaves to remain on the trees until they were fully colored

The coloring of the leaves, like the rose on the cheeks of apples, depends on the ripening process, which is hindered rather than assisted by frosts In fact, a frost which kills the leaves also loosens them and hastens their fall. The mild weather has allowed the leaves to ripen to an unusual degree

Doctors who practice in the country are fortunate in their unique opportunities to see familiar landscapes painted in colors of rare vividness Thrice fortunate is he who has perpetuated the vivid scenes on photographic plates and films The colors of autumn leaves transported indoors for decorations, are only faint suggestions of their vividness on their native hillsides

There are still unnumbered miles of scenery unmarred with flaming advertisements like those in the accompanying cartoon

No one has enjoyed the Indian Summer weather more than doctors whose practice compels them to drive over country roads The *New York Times* of November 6 contains the following discussion on the origin of the term

"A common impression that Indian Summer passes with October needs correction Indian Summer days do occur toward the end of that month, but they extend into November and are sometimes experienced even early in December November can lay claim to the true Indian Summer weather, which is ethereal mildness with a touch of frost in the morning and an amber sunset in a clear sky All day a haze softens the blue of the hills

Nothing was printed about Indian Summer in American books until in the year 1794 Horace Walpole in 1778 used the expression, but he was writing about weather in India and the West Indies It does not appear that the early settlers ever gave the name to the fine days in the Fall of the year The American Indian cannot be connected with it

An impression of Indian Summer by the Cartoonist in the NEW YORK HERALD TRIBUNE, *October 23, 1929*

"In the Encyclopedia Americana the origin of Indian Summer as a term is variously explained that the Indians predicted such weather, that it was named after the smoke of their fires, that it was the last season when attacks were made on settlements But none of these theories is satisfactory"

COLOR BLINDNESS

The most common form of color blindness is an inability to distinguish red from green, for both appear gray in color But no color seen in ordinary life is pure, and any means which will bring out the accessory colors will aid the color-blind to distinguish red from green Such a method is described in the *New York Times* of October 18 as follows

"But now Professor Franz Weidert of the Technical College in Berlin promises relief He has invented new glass materials to be fitted into spectacles for the color-blind The

product resembles ordinary glass and seems perfectly transparent when made up in thin sheets It contains neodymium and praseodymium Certain colors of the spectrum are missing from light rays that pass through this glass

"The colors chiefly absorbed are in the orange and yellow range which lies between the reds and greens The use of the new glasses should make it very easy to distinguish between these two colors by accentuating the contrast between them As red and green are the most commonly baffling colors, the new invention should prove a substantial help to the color-blind"

HOME REMEDIES

Edward Hope is back at his desk in the *New York Herald Tribune* as editor of the column called "The Lantern" The issue of November 18 contains Mr Hope's explanation of his five weeks' absence in the following description of an attack of sciatica.

"We elected to call in scientists to theorize, when we had only to take the advice of charitably disposed friends, acquaintances and strangers, if we were really in earnest about regaining the use of our left leg

It is over now, but we shall know better the next time.

We had never realized before how generally sciatica is in vogue We had heard the word—usually in connection with the trials of octogenarians and piano movers—but we had thought that the ailment was one of the less popular troubles, like anthrax and African sleeping sickness We have learned that it is as common as pyorrhœa or any of the other nationally advertised diseases And, furthermore, nearly every case is being, or has been, cured in practically no time by some plain, old-fashioned remedy

For the benefit of those who are suffering now and don't care to canvass their friends for recommendations we publish herewith some of the outstanding suggestions that have been offered us

Wear around the waist a band of red flannel ten inches wide Have all teeth extracted Sit for twelve (also ten, fifteen, seventeen and thirty) minutes in a hot bath containing a pound (two, three pounds) of epsom salts Ditto bicarbonate of soda Have your tonsils removed Rub a little capsicum vaseline on the small of your back every night Have a chiropractor look at your backbone Take several (we forget) grains of quinine night and morning Lie flat on the floor for twenty minutes at a time three or four times a day Take a brisk walk for an hour every morning Drink the juice of one lemon night and morning Have your sinuses seen to Stop smoking (ditto drinking alcohol, coffee, tea, eating red meat, green vegetables, sweets, tomatoes) Take acidophilus milk Do setting-up exercises

There is no room for the rest We still limp, anyway, and shall, therefore, have other prescriptions offered to us at every turn, that is, when we are able to make a turn without screaming aloud

DETECTORS OF CARBON MONOXIDE

It always seems a bit cruel to use canary birds in order to detect the presence of carbon monoxide in the air The *New York Herald-Tribune* of November 18 contains the following description of the use of tomato plants instead of canaries

"Some recent examples of plant protection are described by Dr William Crocker, director of the Boyce Thompson Institute for Plant Research, who is one of the pioneers in discovering gas-sensitive properties of plants

"A large American coke works is using tomato plants to insure against gas leaks about its ovens One of the leaks guarded against comprises the invisible ingredients of illuminating gas In the presence of these gases, the leaves of young tomato plants droop, grow stiffly downward and even form coils, due to rapid growth on the upper side of the leaf The plant is 200 times as sensitive to this poison as is the human nose, and fifty times more sensitive than the best chemical test

"As long as the leaves of the tomato plants remain in their normal posture, it is assured that the air about the oven is pure beyond the best powers of human detection

"In the home, Dr Crocker says that white carnations are good gas indicators One part of gas in 80,000 makes carnations 'go to sleep'—that is, half close and remain so There is no danger to human beings in such slight gas concentrations But the plant gas-detectors might explain the source of an occasional headache due to unsuspected gas poisoning"

BOOK REVIEWS

IMPERATIVE TRAUMATIC SURGERY WITH SPECIAL REFERENCE TO AFTER-CARE AND PROGNOSIS By C R G FORRESTER, M D, F A C S Octavo of 464 pages, illustrated New York, Paul B Hoeber, Inc., 1929 Cloth, $10 00

This is a personal book and is based entirely upon the experience of the author This experience has been extensive and over a long period of time

Different methods of treatment of injuries are not described, but rather a single method, the choice of the author, and what he has found to be satisfactory

Not a few rather important subjects are found wanting in the text, such as injuries and infections of the hand other than those involving the bones Some subjects are too briefly dealt with in regard to their clinical importance i e., the chapter on compounded fractures and their complications This subject might well have been given a little more space and the indications for different types of treatment have been a little more definite Then too, such subjects as the treatment of burns, crushing injuries, amputations and compound joint injuries might well be included in a text-book of this type

On the other hand there are certain outstanding chapters, especially those chapters dealing with injuries to the knee joint This difficult subject has been dealt with in a masterly manner and very completely The illustrations and description of methods of treatment are very well done The text concerning peripheral nerve injuries is another outstanding feature of the book

The question of prognosis is described in a clear, concise manner and is conservative enough to show the wide experience of the author This is an important subject and many surgeons of too little experience are wont to be far too optimistic in the prognosis of some of the more severe injuries That part of the text dealing with the prognosis in such cases should be of great value, not only to the individual surgeon but also to those agencies connected with Workmen's Compensation, particularly the administration of the Act.

Text-books of this type are all too few in our present day literature and this book should be welcomed as a reference for the general surgeon and the increasing number of surgeons interested in traumatic surgery, to the end that the final results of the treatment of the injured will show a much to be desired improvement.

S POTTER BARTLEY

COMMON COLDS Causes and Preventive Measures By LEONARD HILL, M.B, F.R S., and MARK CLEMENT Octavo of 126 pages London, William Heinemann, Ltd, 1929 Cloth, 7/6 net.

This book presents an interesting discussion of the subject The role of infection and the bacteriology are considered and the influence of chilling and draughts As preventive measures, diet, light, proper ventilation, means of preventing infection, hygiene and vaccines are discussed With regard to the latter, the evidence cited is generally favorable and it is suggested that the time for protective inoculation should be in July or August to prevent colds in the autumn

"It is generally agreed that neither the etiology or the prevention of colds is established on a scientific basis" What there is known is well presented

W E. MCCOLLOM

THE NEUROSES By ISRAEL S WECHSLER, M D Octavo of 330 pages Philadelphia and London, W B Saunders Company, 1929 Cloth, $4 00

This is a medium-sized volume, conveniently arranged and indexed for ready reference. The subject is discussed in a manner both interesting and instructive. Various viewpoints are expressed frankly and without apparent bias, and one finds it increasingly attractive as he reads despite any preconceived ideas he may have had.

In chapter one, there is a short but comprehensive history of psychiatry and the development of psychopathology in which the author interestingly shows the evolution of the modern conception of the care and treatment of mental disease.

Then follows a discussion of mental mechanisms which alone is worth any one's time to read and prepare for a better understanding of what follows

The neuroses are discussed from the standpoints of etiology, classification, clinical symptoms, diagnosis, course and prognosis, and treatment.

Under etiology, the somatic, psychologic and social biologic theories are taken up at length, including psychoanalysis in its relation to the interpretation of mental disorders

The chapter on clinical manifestations is interesting and cases are cited to illustrate certain symptoms and mechanisms.

In a discussion of diagnosis, course and prognosis differential points are stressed and the need pointed out for careful physical and mental examinations.

Under treatment are considered the approach to the patient and the importance of gaining his confidence, the glandular extracts, drugs, rest cures, suggestion, hypnotism, persuasion and psychoanalysis.

Then follows suggestions for history taking and examinations, general intelligence in psychoneuroses and some psychometric tests

The book should be a valuable addition to any medical library

A. E. SOPER.

COMMON DISORDERS AND DISEASES OF CHILDHOOD By GEORGE FREDERIC STILL, M.A., M D Fifth Edition. Octavo of 1032 pages, illustrated. New York and London, Oxford University Press, 1927 Cloth, $9 00 (Oxford Medical Publications)

In evaluating a book of this kind it is in order to consider the object of the Author and we can take his word for this, He says "It is no systematic treatise. I have chosen rather to be selective and *discusive* as it suited my bent."

The author does not show dogmatism as would a typical German or some of our American authors, conscious that they have complete and absolute knowledge of their subject of which their readers know nothing, but rather he is inclined to be verbose or—shall we say—chatty

It lacks the precise and detailed advice of a good students' textbook, but if one seeks a good teacher or rather consultant, of the "Come, let's talk it over" type, there is very much of value to be found in this book.

Five Editions testify to continued appreciation.

W D L.

THE NOSE, THROAT AND EAR, AND THEIR DISEASES In Original Contributions by American and European Authors. Edited by CHEVALIER JACKSON, M D, and GEORGE MORRISON COATES, A B, M D Octavo of 1177 pages, illustrated. Philadelphia and London, W B Saunders Company, 1929 Cloth, $13 00

This is a work of broad design written by seventy-four authors. Each has been assigned a subject pertaining to ear, nose or throat, and many of the articles are by authors who have previously distinguished themselves in the particular fields they write of The editors have moulded the work into a complete and comprehensive system of the medical and surgical treatment of ear, nose and throat diseases Since the book by De Schweinitz and Randall published in 1899, no work of such inclusive and encyclopedic character has been published on this subject in America Nothing that is not in admiration and approval can be said of the editor's attempt to crystalize in one book the present-day aspect of this division of medical and surgical science in this country The articles themselves are a proof that the response of the contributors in carrying out the idea has been conscientiously and exactingly performed, and it is safe to say that this book will be the most generally consulted by specialists on the subject for many years to come. It is not a text-book Specialists refer to these on occasions but the specialist wants to know frequently how much of his own ideas parallel or deviate from his next-door or next-city neighbor, he wants to see if his own technique bears the stamp of general approval whether certain points new or as yet disregarded are included Thus such a book begets new papers, stimulates new effort It is a landmark a milestone of progress

W C B

Two books entitled, "Surgical Pathology" have been received One by Drs Wakeley and Buxton was reviewed in this Journal on September 15, 1929, page 1163 The other, by Dr William Boyd, was reviewed in this Journal of November 1, 1929, page 1353, but its introductory description was a repetition of that of the book by Drs. Wakeley and Buxton Therefore, in order to rectify the error, we are repeating both reviews —*Editor's note*

SURGICAL PATHOLOGY By CECIL P G WAKELEY, F R C S, and ST J D BUXTON, M.B., B S Octavo of 904 pages, illustrated. New York, William Wood & Company, 1929 Cloth, $12 50

This is a splendid book particularly for the surgeon, who by becoming a better pathologist becomes a much better surgeon

The cuts are excellent, the reading matter is clear and interesting

The work covers the entire field of pathology from the surgical standpoint. Enough histo-pathology is presented to clarify the pathological anatomy where this is desirable

M E. MARTEN

SURGICAL PATHOLOGY By WILLIAM BOYD, M D Second Edition. Octavo of 933 pages illustrated Philadelphia and London W B Saunders Company, 1929 Cloth $11 00

The reviewer believes that this book is a valuable contribution to the working library of surgeons and internists It is remarkably well up to date as shown by references to Ewing's views on radiosensitivity of tumors, Masson's new theory of melanomata and other subjects under current discussion. The section on the thyroid comprises 46 pages and deserves careful reading Other notable sections are those on the stomach, cholecystitis, chronic appendicitis, endometrial implants, the reticulo-endothelial system, the spleen, bone diseases and brain tumors The author gives the latest views on these subjects The more common diseases are fully discussed including symptomatology where it seems of value. The author has a true gift for writing word pictures of gross pathology At the end of each chapter is a short list of references to recent English literature.

The book is profusely and beautifully illustrated and is a fine example of the publishers art The reviewer heartily commends this book to the surgeon who wants an up-to-date working pathology by a man who writes well and knows his subject thoroughly

E. B SMITH

ANNUAL REPRINT OF THE REPORTS OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR 1928 Cloth. Price, postpaid, $1 00 Pp 75 Chicago American Medical Association, 1929

This book is a great deal more than a mere record of the negative actions of the Council on Pharmacy and Chemistry It gives in full the reasons for the Council's rejection of various preparations, but it also records results of the Council's investigations of new medicinal agents not yet out of the experimental stage, and frequently contains reports on general questions concerned with the advance of rational drug therapy All three categories of reports are found in this volume.

NEW AND NONOFFICIAL REMEDIES 1929, containing descriptions of the articles which stand accepted by the Council on Pharmacy and Chemistry of the American Medical Association on Jan 1, 1929 Cloth. Price, postpaid, $1 50 Pp 488, xlvii Chicago American Medical Association.

This book offers a solution to the problem of the busy physician who is daily importuned by "detail" men to try the thousand and one new preparations brought out by enterprising manufacturers of pharmaceuticals If the preparations in question is not described in "New and Nonofficial Remedies," it is quite safe to refuse to try it no mater how alluring the salesman's talk. The book contains descriptions of those new preparations which, after painstaking examination, the Council of Pharmacy and Chemistry has found worthy of recognition of trial by the medical profession. It is revised each year to bring it up to date with the best medical thought and to include the new preparations that have been recognized during the year as well as to delete those which have been found not to live up to their promise of therapeutic value.

In this edition there appears for the first time an article on liver preparations and their therapeutic use. The articles on ergot, metallic peroxides, pituitary glands, and radium and radium salts have been considerably revised Among the new preparations which have been included in this edition are diphtheria toxoid, metrazol liver extract No 343 and concentrated liver extract-Armour, bismuth sodium tartrate-Searle, scarlet fever toxin-P D & Co, parathyroid hormone-Squibb and paroidin An important deletion is the omission of all generators charged with radium

A new departure in this edition is a list of "exempted" articles This comprises some hundred and thirty medicinal and non-medicinal products examined by the Council and found to be of such composition and to be so marketed as not to require acceptance or rejection by the Council under its rules

A section of the book (brought up to date each year) gives references to proprietary articles not included in "New and Nonofficial Remedies." This list, in conjunction with the book proper constitutes a cumulative index of proprietary medicines, which physicians may consult when a proprietary product is brought to their attention Physicians cannot dispense with the use of the newer remedies that are brought out each year yet they can neither judge them on the basis of the manufacturers' claims nor have they the time or the means to determine their merits for themselves For this reason, every physician should possess a copy of this volume, which annually puts at his disposal an authoritative, up to date, and unbiased estimate of these preparations

OUR NEIGHBORS

MICHIGAN ANNUAL MEETING

The annual meeting of the Michigan State Medical Society was held in Jackson, September 17-19, 1929, and its minutes are recorded in over fifty pages of the November issue of the Journal of the Michigan State Society The President's address was given on the evening of September 18 by Dr Louis J Hirschman of Detroit, and was printed in full in the October issue of the Michigan Journal

Internship with a preceptor Dr Hirschman made a suggestion regarding the substitution of a preceptorship for a part of the interne year as follows

"It is sincerely hoped that the State Board of Registration in Medicine will soon find it possible to allow substitution of bedside and office training under a qualified preceptor, for at least a portion of the time now devoted to internship and hospital training This is the only way in which the coming practitioner of medicine can really be trained in bedside medicine, under conditions under which a large portion of his practice will be conducted, particularly, but not necessarily, in small communities He will learn how to meet situations arising in the patient's home, particularly with reference to his attitude to—and his management of —the various members of the patient's household He will also make contacts which will be of great value to him later if he decides to locate in the town in which he has served this apprenticeship"

Public Relations Dr Hirschman also addressed the House of Delegates on September 17 Concerning public relations he said

"I would suggest that some special effort be made to establish contact between our society and of the various lay organizations such as chambers of commerce, civic associations, luncheon clubs, fraternal organizations, women's clubs, parent-teachers associations and organizations of our sister professions, the law, engineering and the ministry With the co-operation of organizations of thinking, intelligent and interested citizens, perhaps we can awaken sufficient interest in the citizenry of our state to stand together for self-preservation in health matters

"In every large center of population as well as the smaller communities who possess public libraries and reading rooms, our state society should assist, so far as it is necessary, the county society in providing medical literature which is written for the lay public Copies of Hygeia and all of the pamphlets issued by the American Medical Association for the public should be placed on the reading tables of these libraries and the supply constantly renewed This distribution should be in the hands of a committee appointed by each county society or by their secretary as the case may be"

City Representation The representation of the physicians in the large cities is engaging the attention of the doctors of Michigan, as well as those of New York The President said

"The Wayne County Medical Society representing nearly one-half of our membership and a county which contains a large medical center, the fourth city in population in this country, has not for many years been properly or proportionately represented in our official delegation to the American Medical Association

"It is time that this representation cease to be made a political foot-ball, and justice, fairness and equity be observed It is hoped that as vacancies occur that Wayne County with its nearly fifteen hundred members be represented by a minimum of two delegates in the future"

Ex-Presidents What to do with the ex-presidents has also been considered in Michigan, where office holding does not seem to be a preparation for a wider field of service, as it is in New York State Dr Hirschman said

"As has been said above, the members of this organization who have achieved the distinction of acting as its president have acquired a large fund of knowledge, information and experience which is of great value to the society There is no reason why this experience should be lost to the organization after his term of office has expired It is suggested, however, that the services of the ex-president, made valuable by previous contact, be utilized by the society if not in an active, at least in a consulting capacity It is proposed, therefore, that the formation of a board of ex-presidents be considered with the idea of utilizing their influence and experience in matters involving ethics, policy, finance or legislation, should at any time the officers or council of the society feel the need of such support"

There was a considerable debate over the president's suggestion, in the course of which the President said

"I thought they really should be tied up in some way with the activities of the Society I was agreeably surprised when Dr McCormack mentioned that they have such an organization in Kentucky He told me of that I hadn't heard of it They do use those men for the same purpose for which it is our intention to use them"

(*Continued from page* 1484—*adv xii*)

You too, will consider this milk ideal!

Because:

1. It is always stable as to its constituents and vitamin potency.
2. Its use assures definite caloric intake, unfluctuating from day to day, or feeding to feeding.
3. Without modification, it forms small flocculent particles upon ingestion; the protein is 97% assimilable.
4. It can be easily modified in indicated cases and furnishes an excellent base for any formula.
5. It is free from pathogenic bacteria, eliminating the danger of milk-borne infections.
6. It has achieved an enviable record of results in infant feeding over a period of many years.

CAMP
Supporting Garments
Remarkable Results with this New
Post-Operative Support

A new Camp garment particularly designed for physiological support following stomach or gall bladder operations The Camp Patented Adjustment provides support and proper uplift where needed. It insures diaphragm control without restriction The elastic insert at operative point supplies the required softness without loss of firmness, and gives satisfactory sacro-iliac support. Leading physicians and surgeons everywhere endorse the garment as a preventive of post-operative complications, and praise the extreme comfort it affords the patient

Obtainable in all of the better surgical goods houses, drug stores and department stores

It was finally voted to refer the matter to the committee on constitution

Function of Vice-Presidents Dr Hirschman would utilize the vice-presidents as follows

"Each vice-president should be actively engaged in some one of the activities of the society It might be desirable to divide the state into four sections and have one of the vice-presidents in charge and to act with the group of councilors in his section, in all matters which are purely sectional in character

"As our post-graduate activities increase it might be desirable to have the vice-president take active charge of these activities in his section of the state During the past year your president has requested the presence of one of the vice-presidents at each executive and council meeting in order that he might be familiar with the workings of our organization It is hoped that this will continue I believe that it would be extremely desirable to make each vice-president the chairman of one of the important committees In this way, each vice-president would become an active unit of our society organization and become a functioning official instead of being part of the ornamental background"

President-elect Dr Hirschman also gave a lengthy argument in favor of amending the constitution so as to provide for a president-elect

Council Activities The Council submitted the following list of subjects which has engaged its attention

"1 Joint Committee on Public Health Education
2 Medico-Legal Defense
3 Annual Conference of County Secretaries
4 The Journal
5 Bureau of Public Information and Publicity
6 Organization Problems of County Societies
7 Conference with and Representation upon the State Crippled Children's Commission
8 Co-operation with Standing Committees and Especially with the Committee on Civic and Industrial Relations
9 Advisory Conferences with the State Department of Health
10 Advisory Relationship with County Clinics for Crippled Children
11 Bureau of Inquiries for Members
12 Details of Annual Meeting, Section Programs, Commercial and Scientific Exhibits"

Medical Leadership The report of the Council is contained in the following reference to County Medical Societies

"The Council feels strongly that County Societies must assert more emphatically the purposes for which they exist and rightly assume their inherent rights to local leadership and directorship in

all matters pertaining to medical practice and public health

"With regretful concern do we note the relinquishment of this leadership to self-constituted and dis-related groups that are trespassing upon and usurping the rights and prerogatives of County Medical Societies Hospital staffs, clinic groups, independent organizations and lay individuals are invading County Society functions and institute their activities in a most dis-related and, at times, arrogant manner The situation presents a serious problem and danger"

Legislation The Legislative Committee came in for considerable criticism and blame for failing to defeat cultist legislation, which, however, was vetoed by the Governor The Committee discussed the reasons for the influence of cultists with legislators, and made the following suggestions, which were adopted

"1 That the Legislative Commission's report be accepted and the Commission be discharged

2 That the president appoint a new Legislative Committee, by and with the advice of the Council, with the State Secretary as an ex-officio head of the committee

3 That the Legislative Committee be instructed to conduct a lay educational campaign and comply with the provisions of our by-laws

4 That the Legislative Committee be instructed to attempt to secure at least two representatives of the profession in the Senate and two in the House

5 That the Council request the Joint Committee on Public Education to arrange a series of talks related to Medical Legislation and impart them through their channels of public contact"

It will be noted that the recommendations include the education of the people, but the recommendations stop short of the effective plan of New York State,—that of charging lay health organizations with the duty of influencing legislators It has been demonstrated time and again all over the nation, that law makers will not listen to doctors, but that they will listen to laymen who urge health legislation

Hospital Practice A motion to disapprove the action of the University of Michigan Hospital in soliciting paid patients over the radio was disapproved by a vote of 21 to 14

Nearly six pages of the proceedings were filled with a discussion on permitting cultists to treat patients in public hospitals Dr Riley of Jackson said

"We had some patients in the hospital where the people were Faith Healers They wanted to bring the chiropractor in and they asked me if it was all right. I said 'No' They went to the superintendent of the hospital and she said 'No' Then they went down to the City Commissioner,

(*Continued on page* 1488—*adv xvi*)

SATISFYING HUNGER *in* DIABETES

When you prescribe for a diabetic patient keep in mind the efficacy of Knox Gelatine as an agent for satisfying appetite without violating the most rigid protein diet.

Here is the purest of gelatine, uncolored, unflavored and unsweetened. It may be combined with such fruits, vegetables, and other foods, as are prescribed for a diabetic patient—and served as a dish *so appetizing in taste and appearance, so satisfying in bulk,* that the most eager appetite will find itself happily abated.

Recognized dietetic authorities have prepared dishes made with Knox Sparkling Gelatine that are a real contribution to the successful treatment of diabetes. Here are two recipes that will aid you in giving diabetic patients complete instructions for home co-operation with your treatment.

KNOX *is the real* GELATINE

Contains No Sugar

JELLIED VEGETABLE SALAD (*Six Servings*)

	Grams	Prot.	Fat	Carb.	Cal.
1 tablespoon Knox Sparkling Gelatine	7	6	—	—	—
¼ cup cold water 1½ cups hot water	—	—	—	—	—
1 teaspoonful whole mixed spices	—	—	—	—	—
½ teaspoon salt, ¼ cup vinegar	—	—	—	—	—
½ cup chopped cabbage	50	1	—	3	—
½ cup chopped celery	60	1	—	2	—
½ cup canned green peas	40	1	—	4	—
½ cup cooked beets, cubed	40	1	—	3	—
Total	10	—		12	23
One serving	2	—		2	15

Soak gelatine in cold water for five minutes. Bring to boil water salt and spices. Pour on gelatine to dissolve it and add vinegar. When jelly is nearly set, stir in the vegetables, pour into mold and chill until firm. Unmold on lettuce and serve with salad dressing. Garnish with sprig of parsley or strip of pimento.

JELLIED CHICKEN IN CREAM (*Six Servings*)

	Grams	Prot.	Fat	Carb.	Cal.
1 tablespoonful Knox Gelatine	7	6	—	—	—
¼ cup cold chicken broth or water	—	—	—	—	—
1½ cups boiling chicken broth, fat free	—	—	—	—	—
½ teaspoon salt	—	—	—	—	—
Pinch pepper	—	—	—	—	—
1 cup cooked chicken, cubed	125	24	20	—	—
¼ cup cream, whipped	55	1	22	1.5	—
Total	31	44	1.5		325
One serving	5	7	—		23

Soak gelatine in cold liquid for five minutes and dissolve in hot broth. Season with salt and pepper and chill until nearly set. Fold in chicken and whipped cream. Turn into molds and chill until firm. Serve on lettuce or garnish with parsley and strip of pimento.

If you agree that recipes like the ones on this page will be helpful in your diabetic practice, write for our complete Diabetic Recipe Book—it contains dozens of valuable recommendations. We shall be glad to mail you as many copies as you desire. Knox Gelatine Laboratories, 432 Knox Ave., Johnstown, N. Y.

I guess, to get action and allow them in In the meantime the patient died.

"We had another situation We had a man in town who said he had gotten an M.D degree from some place in Georgia. He got this degree about 1903 or 1904 He took up osteopathy and worked on that Then he decided it wasn't very profitable, so he tried for a reciprocity The board denied him, but I guess he got it through the court Now he practices osteopathy and surgery and anything that he cares to in the city hospital, but they do not allow him in the Sisters' Hospital"

The discussion ended, as do many in all Houses of Delegates, in referring the matter to the Council

There were four pages of discussion regarding the establishment of general hospitals by counties with state aid, and then the question of establishing county departments of health with state aid was injected and became the dominant subject. A motion to appoint an investigating committee on the subjects was lost by a vote of 12 to 23

Then followed a five page discussion on free medical service during which some one moved that no doctor should treat a case in a free clinic unless the patient brought a letter from a doctor All motions to investigate the problem were lost, but later the discussion was renewed covering about seven more pages of the Journal A motion to investigate the problems was finally carried

SOCIAL HYGIENE IN WASHINGTON STATE

The November issue of *Northwest Medicine* contains a leading article on "The Progress of Social Hygiene in Washington" by Dr W R Jones of Seattle, who says

"Seattle in 1913 established the first municipal venereal clinic in the United States In 1917 Seattle and Tacoma were the first cities to consider prostitution a health department and not a police problem, when they locked up their "part-time ladies as disease carriers"

"The present Seattle venereal clinic is recognized as nearest meeting the approval of four divergent interests, the sick one, wanting all he can get for nothing, the doctor, losing patients to the clinic, the health department, striving to reduce venereal disease, and the public, paying the bills Only indigents and persons who are a distinct menace to the public health are given treatment in the public clinics"

Concerning houses of prostitution the author says

"The vice industry for its own protection tries to eliminate disease carriers Girls are no longer

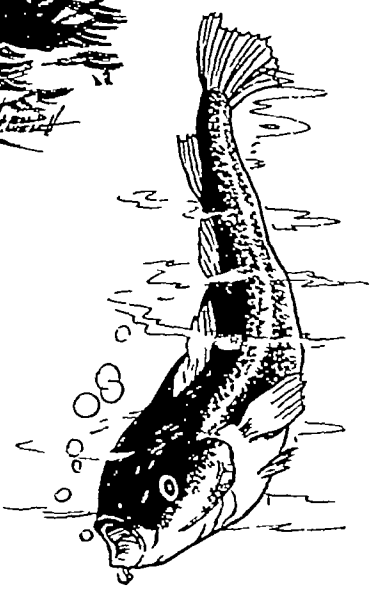
When this *Trawler* makes port



she brings fresh fish for the market and cod liver oil for PATCH, because she is one of the beam trawlers equipped with a Patch cooker, in which a Patch worker extracts the oil from the fish livers as they are caught—a floating Patch plant to insure the quality of your cod liver oil

This method of extracting fresh cod liver oil, rich in the vitamins A and D, is a Patch patent and one of the developments pioneered by Patch for the production of this modern, palatable, vitamin potent cod liver oil.

There is no substitute for cod liver oil, and Patch's Flavored Cod Liver Oil presents a product that is unusually palatable, standardized for vitamin A and D potency, and offers these vitamins in familiar dosage

May we send you a sample bottle for a demonstration of its palatability?

led astray They break loose and run The madames encourage girls to keep on the straight and narrow path, otherwise they become competitors Competition is so keen that in some places sex perverts are used as business boosters

"The chain store system has invaded the brothel with the same methods and results as in other lines, cutting prices and catering to certain classes as sailors, loggers or the like In all possible ways they stifle competition Both customers and girls are given consideration Girls are given regular working hours and good quarters with sanitary conveniences

"A new girl must first be examined before going to work, and old ones reexamined frequently for venereal disease Big business, like the privilege of examining girls, is given to a physician by some previous arrangement Flexible thoroughness of examination, cheapness and political expediency are all of importance

"Girls with a venereal disease are not permitted to work, neither are they turned out They are sent to the public clinic or some private physician who is willing to take a chance on being paid for treatment They always pay the doctor the first call, often the second and occasionally the third"

Medical certificates are discussed as follows

"The Washington law prohibits the giving of certificates as to freedom from venereal disease In reality, doctors feel that a certificate is a recommendation for the girls So long as the hotel clerk and bell hop and taxi driver and her 'steady' recommend her so highly, the doctor's recommendation is superfluous Health certificates in the hands of prostitutes are now passe"

Educational lectures are given and the author says

"A lot of buckaboo relative to social hygiene and venereal disease has hitherto been broadcast by well-meaning but misinformed individuals who did not entirely confine themselves to truth The distribution of social hygiene information belongs to the medical profession The Social Hygiene Committee and the Public Health League cooperate to place physician speakers before any lay audience that is receptive They even furnish speech material and illustrations All lectures furnished are as a physician would give them and entirely without sentiment"

The author discusses personal instruction as follows

"A minimum of sexual instruction may well suffice for the person of high school education The girl can be merely told to leave the genitourinary apparatus entirely alone, except for cleanliness, that if she has sexual relations, one of two things will eventually happen, she may be lucky a few times but the inevitable will come She will either become pregnant or contract ven-

ereal disease, probably having both experier

"With this impressed on the memory, the telligent girl can be trusted so long as she s sober When drunk, no one can be trusted last is not limited to the younger generation

"The boy can be told about the same It he relations with a clean girl, she will likely bec pregnant, if with the other kind, it is only a q tion of time until he becomes diseased It game that cannot be beaten"

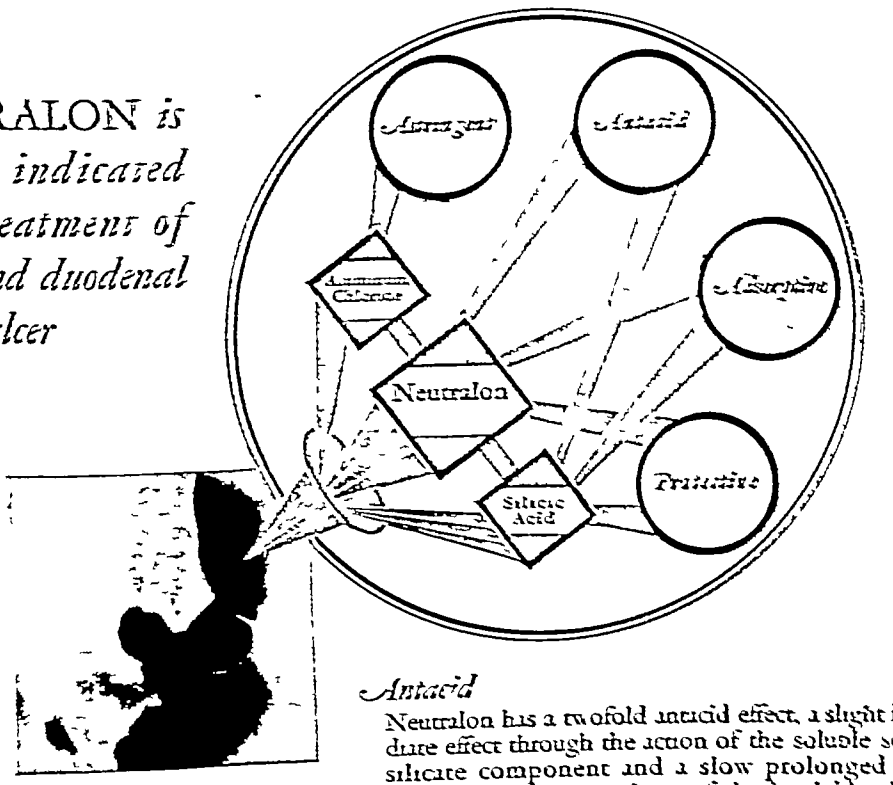
The author's opinion regarding the incidence venereal disease is as follows

"An estimate from what we have learned wo be that one and one-half or two per cent of total Washington population is syphilitic, two one-half or three per cent of the industrial wo ers are, ten to twelve per cent of the crimi element, as represented in the reformatory penitentiary, are luetic Five per cent of feeble-minded and seven to ten per cent of adult insane have syphilis, seasoned prostitu approximate twenty-five per cent syphilitic, chippie, fleet follower, or dance hall girls lower, perhaps twenty per cent, because of having had time enough to acquire the infecti

"Including gonorrhea, at least fifty per cent the prostitutes are venereally infected and of younger, those around twenty years old, perha seventy-five per cent are."

VIOLATION OF NARCOTIC LAWS

Kentucky is having trouble with some of doctors who violate its narcotic laws The Oct ber issue of the *Kentucky Medical Journal* co tains a report of the Council of the State Socie in which the violations are discussed as follows



"Again this year a considerable number physicians have been convicted in the State Federal courts for violation of the narcotic prohibition laws Acting under your instruction the Council has, or will, when their penitentiar terms have expired, prefer charges against eac of them with the view of revocation of their ce tificates to practice medicine in Kentucky Th Council finds that the administration of thes laws, which are approved by a vast majority o the physicians of Kentucky, has been made un necessarily irksome to the competent, honest, self respecting members of the medical profession b their violation by the very small minority wh have continued to ignore their plain purposes an provisions Regardless of individual opinion a to the wisdom of such a law, it is now wel known by every physician in Kentucky, and in every possible way the public should be taught, that, under Federal law, narcotic habitués are not considered as having a disease and that they can not be treated by providing narcotics under any circumstances It is equally plain that alcohol in

The Action of NEUTRALON

A synthetic aluminum silicate with about twelve per cent sodium silicate

NEUTRALON *is specially indicated in the treatment of gastric and duodenal ulcer*

Antacid

Neutralon has a twofold antacid effect, a slight immediate effect through the action of the soluble sodium silicate component and a slow prolonged effect through the decomposition of the insoluble aluminum silicate which converts free into combined acidity

Astringent

The aluminum chloride formed by the reaction of Neutralon with the acids of the stomach acts as a mild astringent, thus tending to limit gastric secretion.

Adsorptive

Neutralon and the silicic acid adsorb albumen and excess pepsin so that the harmful digestive action of pepsin on the ulcerated wall of the stomach is hindered

Protective and Analgesic

Unchanged Neutralon and the silicic acid formed during the course of the reaction tend to form a coating on the ulcerated wall of the stomach, thereby affording protection against mechanical and chemical irritation

DOSAGE The usual dosage of Neutralon is a teaspoonful stirred in half a glass of water three times daily, before meals when the protective and astringent action is required, and after meals as an antacid.

ORIGINAL PACKAGES:

NEUTRALON
Boxes containing 50 and 100 grams.

BELLADONNA-NEUTRALON
Boxes containing 100 grams.

BELLADONNA-NEUTRALON
is Neutralon with the addition of 0 6% extract of belladonna.

NEW YORK, N Y

(*Continued from page 1492—adv xx*)

any form can only be prescribed legally for patients who have actually been examined by, and who are under the treatment of the physician writing the prescription for a definite disease in which such alcoholic medication is indicated It is with regret that the Council notes the reports of the Federal authorities that they are finding frequently prescriptions for alcoholic beverages signed by physicians who have not only not examined these patients, but they have not infrequently been issued in fictitious names, and that, in some instances, these prescriptions were filled for the physicians themselves Such action is a breach of trust that is absolutely inexcusable, and any member of our profession who prostitutes the duty imposed upon him by law, of determining whether medicines containing alcohol shall be used in the treatment of disease, deserves no sympathy when he is indicted and imprisoned"

EXPERT TESTIMONY

The November issue of the *Rhode Island Medical Journal* refers editorially to medical testimony at a murder trial in New York State where two doctors swore the defendant was sane and two others that he was insane The editor had the Rhode Island law in mind when he said

"The medical profession should get behind legislation which would tend to make impossible the present spectacle of members of the medical profession forced to examine an individual separately for the defense and another group separately for the prosecution If it were stipulated that the State should employ one expert and the defense another, and that these two should agree upon a third, or, in case they could not agree, that the State Medical Society should name a third expert, and that these three medical men should constitute a commission to examine the defendant jointly, and report as a commission, we would immediately strike a serious blow at the present commercialism which exists too frequently in medical expert testimony Such a move should be backed solidly by the medical profession, and there is every reason to believe that if the medical profession should agree on this type of legislation, it would meet with the highest cooperation of the legal profession, especially that part of it constituting the Attorney General's office But until such time as this action is taken by the state medical society, or by the American Medical Association, it is probable that the present unfortunate situation will continue to exist, and a house divided against itself cannot command respect"

MINERAL OIL *has its therapeutic indications*

The same is true of **MILK OF MAGNESIA**

The former is a lubricant, the latter is laxative and antacid Hence, a uniform, permanent, unflavored emulsion of Milk of Magnesia and Mineral Oil deserves consideration and secures results

Magnesia-Mineral Oil (25)

HALEY

PRACTICING COMMUNITY HEALTH

In the President's page of the *Wisconsin Medical Journal* for November, Dr F J Gaenslen describes contrasting conditions in the practice of community medicine as follows

"In discussing the subject some months ago with a physician in a small community, one of eleven hundred people, it was learned that this physician some years ago on his own initiative inaugurated a campaign of Preventive Medicine which could well serve as a model for us all perhaps in some modified form In the first year of his campaign he paid special attention to the prevention of goiter In the second year he stressed toxin-antitoxin treatment for the prevention of diphtheria and vaccination against smallpox. In his experience the objectors gradually dwindled to practically zero, the great majority of parents wishing their children to have the preventive measures advocated, without questioning While in this case the school board furnished and paid for materials used the physician did the work without compensation The physician, while fixing his attention in a given year on some particular phase of prevention, no efforts were spared in his daily contact with families to give proper guidance in whatever health matters presented themselves

"In contrast to the above the following may be of interest In a community of five hundred there was an active demand for the protection of school children against diphtheria Funds were available for the necessary material, also for compensation for individual services, but the difficulty was in finding a physician to do the work The suggestion that nurses be entrusted with this work was wisely and properly declined While local conditions may have justified the physicians in declining to undertake the work, the situation is to be deplored because the work must and will be done, if not by local physicians then by physicians sent by the State Board of Health as the problem clearly involves public welfare

"Situations such as the latter smooth the way for state medicine by preparing the public to look to the state more and more in matters of health To our way of thinking, community health should find its chief supporters in the medical profession The control is still in our hands, but forfeiture is not far distant, unless we measure up to our responsibilities in a broad and generous spirit."

The President's warning will apply equally well to New York State, but the New York physicians have wisely promoted anti-diphtheria campaigns through their County Medical Societies, and have brought toxin-antitoxin within the reach of every child

EDUCATIONAL COMMITTEE IN ILLINOIS

The Illinois State Medical Society has a committee on Popular Medical Education whose work is described in the November issue of the *Illinois Medical Journal* as follows

"Your Committee has been represented at the organization meetings of the Elks Foundation for Crippled Children and satisfactory plans have been set up for crippled children's clinics

"The Chicago Woman's Club has been especially interested in promoting an educational campaign concerning cancer

"The Committee has been represented on the Advisory Council of the Child Hygiene Division of the State Department of Health The Council has approved a plan for work in several counties of the state which will require the cooperation of the Medical Society, Dental Society, and certain lay groups

"Other groups mentioned in this report are the Illinois Federation of Women's Clubs Hundreds of speakers are sent to the women's clubs over the state The Chairman of Public Health and Child Welfare of the Federation has worked very closely with the Educational Committee

"The Illinois Congress of Parents and Teachers and the Educational Committee have also worked together during the past few years

"Cooperation has been given the Chicago Woman's Aid, the Jewish People's Institute, the American Public Health Association, the Illinois State Dental Society, The Home Bureau organization of the state, the Farmers Institutes, the Kiwanis Clubs in promoting Boys' Week, the State Department of Health, and the Woman's Auxiliary

"The Committee has had splendid response from some of the lay-health groups when calls have been made upon them Physicians from many different states have called upon the Committee for copies of radio talks, for outlines for popular health talks, and for books of clippings

"Each member of the Educational Committee gives many hours of time to checking over all the press articles before they are released, in making sure that all talks which are broadcast over the radio are suitable for the public and in keeping with the policies of the Illinois State Medical Society Valuable time is also given in order that representatives of the Committee may meet with representatives of these many lay groups to talk over problems which affect both the medical profession and the public Hundreds of physicians all over the state are cooperating in every way possible to promote this health education campaign"

OKLAHOMA STATE MEDICAL ASSOCIATION

The Oklahoma State Medical Association was formed in 1905 by the merger of the Indian Territory Medical Association (founded 1881) with the Oklahoma Territorial Medical Association (founded in 1893) The November issue of the State Journal, speaking of the progress of the State says

"The medical profession at all times was abreast of, if not far ahead of, the various stages of evolution and organization through which the territories passed into the State Some localities, in fact many localities, erected hospitals, and these were erected by individual physicians, not organizations backed by the State or powerful financial interests As a rule, these hospitals were far ahead of the localities in which they were located One could get his appendix removed long before he could attend any sort of an opera or enter a restaurant and order a boiled lobster or soft-shelled crab Whenever anything medical was undertaken it was based upon and constructed along the lines of modern knowledge up to that time The Oklahoma State Medical Association, and its honored predecessors, the two Territory Associations, did their share and fulfilled their function in keeping pace with modern advances and the demands of a broader knowledge of medicine

THE INTERPRETATION OF GASTRIC ANALYSES*

By ALBERT F R. ANDRESEN, M D, F.A.C P, BROOKLYN, N Y

THE value of examination of gastric contents as an aid to diagnosis has often been seriously questioned, and recently such an authority as Smithies stated that he had abandoned gastric analysis entirely in favor of other diagnostic procedures It therefore becomes desirable to inquire into the causes of this skepticism in regard to a diagnostic method which has been in such extensive use for the past three decades

Before the advent of fractional gastric analyses, the examination of the single specimen of gastric contents usually ¾ to 1 hour following an Ewald meal, was considered all-important in the diagnosis of gastrointestinal disorders The acidity of the contents was the finding upon which all the stress was laid, although some observations were made on color, chymification, admixtures and microscopic findings Adopting an arbitrary normal acidity, observers prated of hyperacidity, hypoacidity, anacidity and various subdivisions of each, and therapeutic procedures, i e, the administration of alkalis or acids, were based on these diagnoses, little attention being paid to the real disease entity causing the secretory changes With improvement in Roentgen Ray diagnosis, many clinicians began to feel that gastric analysis after a test meal was rather superfluous, the only really valuable findings occurring in specimens removed from the fasting stomach In 1914, Rehfuss, the first to popularize fractional gastric analysis by the invention of his flexible stomach tube and by his invaluable physiologic researches on gastric secretion, showed that the high point of the acid secretory curve following a test meal was not necessarily at the ¾ or 1 hour point, but might occur before or more frequently long after this time. He also showed that in normal individuals acid values might be double or triple those formerly considered the highest possible normal values There came then a shift to fractional analysis, and the enthusiasm with which many clinicians went into this work and insisted that certain diseases would produce characteristic curves inevitably resulted in disappointment. As early as 1916, we[1] pointed out that no direct diagnosis could be made from the acid curve, but that of much greater importance was the information to be gained in regard to gastric motility and the origin of bleeding or the location of ulceration in stomach and duodenum An absence of acid secretion during two hours after an Ewald meal was considered to be evidence of a true achylia, until within recent years, when it was shown that many stomachs which failed to respond to the stimulus of the crackers and water would secrete normally or even excessively when stimulated by histamine given hypodermatically So that within the past two years fractional gastric analysis following the hypodermatic administration of histamine dihydrochloride has practically superseded other methods of gastric analysis

TECHNIQUE

The technique followed by us at the Long Island College Hospital in the examination of gastric contents, only slightly modified since the use of the histamine, and with but minor changes since an[2] article on the subject published three years ago, is as follows

1 The patient is given the usual duration meal of one-half cup of half-cooked rice and one dozen raw raisins eight or ten hours before applying for the test, and nothing to eat or drink thereafter

2 On morning of test, the Rehfuss tube is immediately introduced into the stomach and all fasting contents are removed and measured

3 The stomach is lavaged two or three times, or until clear by having the patient drink three or four ounces of water alongside the tube and removing it by suction through the tube. The stomach can thus be demonstrated to be empty

4 With the tube in situ, the patient is given 300 c c of water to drink, and during the swallowing of this water is given 3 c.c of a 1 1000 solution of histamine dihydrochloride (Imido, Roche) hypodermatically By the old method powdered cracker was added to the water, its place now being taken by the histamine, which begins to induce secretion at about the time of the

* Read at the Annual Meeting of the Medical Society of the State of New York - Utica N Y June 5 1929

first fifteen minute interval and therefore corresponds closely to the cracker and water meal

5 At fifteen-minute intervals after the taking of the water meal and histamine, specimens of gastric contents, 4 to 6 cc at a time, are removed and placed in a row of bottles, being filtered if their consistency is too thick

6 At the 1½ hour point, the stomach is completely emptied through the tube, the residue obtained being measured This emptying is not to be done unless one or two of the later specimens have been stained with bile This often does not occur for from two to three hours If no duodenal regurgitation occurs over a longer period, the examination will have to be terminated Such delay is due either to pylorospasm or to pyloric stenosis

7 With the patient lying down and the abdomen exposed the stomach is inflated through the tube, the size and shape of the stomach and the location of the greater curvature being noted

8 The tube is withdrawn and the patient is given a drink of water and a short rest before receiving further instructions in regard to his gastrointestinal study

The *examination* of *the specimens* obtained is done in accordance with the following routine and all the findings are immediately entered upon a chart which becomes a part of the patient's record

1 The first or duration specimen, having been measured and titrated, is examined microscopically for rice or raisin residue, gross blood or pus or other admixtures A slide specimen, stained with Lugol's solution, is then examined microscopically for starch granules, raisin fragments, other food remnants, yeasts, sarcinae, lactic acid bacilli, blood, pus, giant cells, carcinoma cells, parasites or other cytologic evidences of disease In the absence of free hydrochloric acid, a few drops of a filtered specimen are dropped into a very dilute ferric chloride solution to test for lactic acid The information to be obtained from this single fasting specimen is often of more value than that obtained from all of the remaining specimens, and the examination should be performed without delay and with the greatest possible care

2 All specimens, including the fasting specimen, are examined for free hydrochloric acid and total acidity, 1 cc of the contents being titrated against 1/100 normal sodium hydroxide solution, dimethylamidoazobenzol and plenolphthalein being used as indicators The acid values therefore are the same as when using 10 cc of contents and 1/10 normal solution These acid values, being charted as tested, produce curves of acidity for diagnostic study (see figures)

3 Bile, mucus, pus and other gross admixtures may be noted from their color and microscopic appearance

4 Blood, if visible, is charted as $^{v}+^{\circ}$, if occult $+^{\circ}$ Occult blood is tested for as follows a few grains of a mixture of two parts (by volume) of benzidin and one part of barium dioxide, is rubbed up in a petri dish with enough glacial acetic acid to produce a thin, smooth smear on the bottom of the dish A drop of each specimen to be tested is then dropped around the outer edge of the mixture, a deep bluish black color at the margin of contact between the specimen and the reagent being evidence of the presence of occult blood Eight or ten specimens may be examined with one preparation

5 Formerly a Wolff-Junghans test was performed on each specimen and a curve produced, which, however, was found to be of doubtful significance The test was therefore abandoned

Interpretation

Following this technique, there are three groups of findings which are of value in the diagnosis of gastrointestinal disorders, namely, the secretory findings, the motor findings and certain incidental findings

Secretion

The *secretory findings* are entered on a suitable chart, the curve of free hydrochloric acid being represented on our charts by the dotted line, the total acidity by the solid line

Much confusion seems to have been generated in the minds of clinicians as a result of the publication of physiologic research in connection with the factors concerned in secretion of the gastric juice Reading about the various phases of gastric secretion—cephalic, gastric and intestinal, and the continuous phase—has made us wonder what our curves mean The various explanations for the rise and fall of the acid curve—diminishing secretion, secretion of more chlorides in the form of sodium chloride than of hydrochloric acid, or the neutralization of the acid by regurgitated alkaline duodenal contents or swallowed saliva—also have seemed to affect the value of our curves as diagnostic indicators The fact remains, however, that what we are dealing with when we study the secretory curves, is the result of the interplay of all these various factors, the upper gastrointestinal tract acting as a homogeneous mechanism to produce a digestive juice sufficiently powerful and for a sufficient period of time to digest a given meal The secretory curve resembles the curve of reaction of any living tissue to a stimulus, and the method of its production does not need to be considered in making clinical deductions from its characteristics

The normal type of acid curve (Fig 1) shows an increase in acidity during the first ½ to 1½ hours following the administration of the test meal or histamine, and a subsequent decrease A similar curve might be made to represent the reaction of muscle or nerve tissue to any given electric or other stimulus The height of the curve was shown by Rehfuss to vary markedly in different normal individuals, so that the principal in-

dication of normalcy is not the height, but the characteristic rise and fall of the curve This type of curve is rarely if ever found in patients with gastrointestinal disorders Only two possible variations from the normal acid curves, the reflex type and the achylia type, can be recognized

Continued secretion, producing what we have long called a *reflex type* of curve (Fig 2) is characterized by the rising curve or level line of acid secretion with no drop in the second hour and represents a condition in which the response to a stimulus fails to stop at the usual or normal time Such a curve would have to be due either to an excessive or continuous stimulus or to an increased irritability of the gastric glands The continued stimulus may be produced by the continued presence of material in the stomach as a result of pyloric spasm or narrowing, and the increased

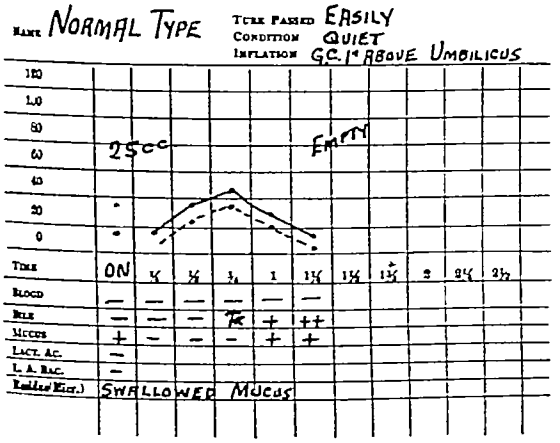

FIGURE 1

Secretion Acid curve down after one hour
Motility Slight fasting residue Empty 1¼ hours
Admixtures Bile regurgitated at end No blood

irritability may be a result of disease within the stomach, or outside of the stomach, but reflexly irritating it It may always represent some degree of gastritis When the reflex curve has persisted for a long time, the glands may take longer to stimulate, and "false achylias," with no secretion in the first hour, but continued secretion later, may result The reflex curve of acidity has been found to occur, especially during the early stages in any abdominal, pelvic, endocrine or nervous condition producing so-called reflex or retrostaltic gastric symptoms, such as fulness, belching, heartburn, sour regurgitation, vomiting, etc It is therefore found in peptic ulcer, early biliary tract diseases, appendicitis or colitis, and in pelvic or genito-urinary conditions, hyperthyroidism, menopause, early tabes, etc.

Absence of acid secretion or *achylia,* represented in (Fig 3), may be due to failure of the acid-secreting glands as a result of disease, pressure or destruction, or to rapid and continuous neutralization or the acid by a constant and profuse regurgitation of the alkaline duodenal contents, as seen in marked relaxation of the pylorus or after operations Although not rare in younger individ-

uals, it is usually found in patients past middle life who have been suffering for a long time from the conditions mentioned before as producing reflex continued secretion, in advanced carcinoma, syphilis and tuberculosis involving the stomach or associated with gastric disturbances, in certain endocrine disturbances such as Addison's disease and advanced hyperthyroidism, during the crises of tabes dorsalis, and in many long-continued wasting diseases Just as with reflex continued secretion, which we consider as evidence of a

chronic gastritis with irritation of the gastric glands, so we consider achylia in most cases as essentially due to a more prolonged chronic gas-

tritis, with inflammation, thickening or atrophy of the acid secreting glands Where excessive neutralization has occurred, as in excessive regurgitation of duodenal contents, in profuse bleeding or in conditions producing much serous discharge (as in carcinoma), this may be sus-

MOTILITY

As a test of gastric motility our method of fractional analysis gives very valuable informa-

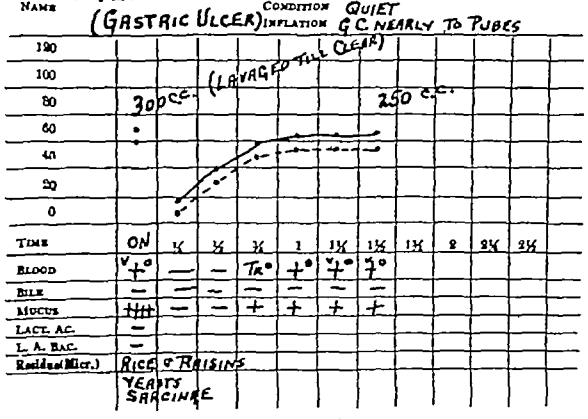

FIGURE 5

Secretion High in residue Rapid rise
Motility Overnight retention Large residue at end
Admixtures Blood in specimens from pylorus—gastric ulcer No blood in a duodenal ulcer
In fasting contents Food remnants, yeast and sarcinae

tion The quantity and character of the first or retention specimen is a well-known index of pyloric obstruction A large amount of this overnight residue and the presence of gross rice and raisin particles has always been considered good evidence of an organic narrowing at the pylorus Even the finding of microscopic starch granules has been thought significant of a moderate degree of narrowing and though this may be considered true in the case of ambulatory patients sitting in a chair and moving about, it is a sufficiently frequent finding in hospital patients lying at rest in bed to be considered of no importance in such cases The quantity obtained at the end of two or two and one-quarter hours after a cracker and water meal and one and one-quarter hours or one and three-quarter hours after the water meal and histamine is another valuable aid in the determination of gastric motor efficiency The water meal has been combined with the hypodermatic administration of histamine in order to get the benefit of this test of motility The normal stomach should be empty or should contain not more than 50 or 75 cc at the end of that time A very small residue at the two or one hour period or

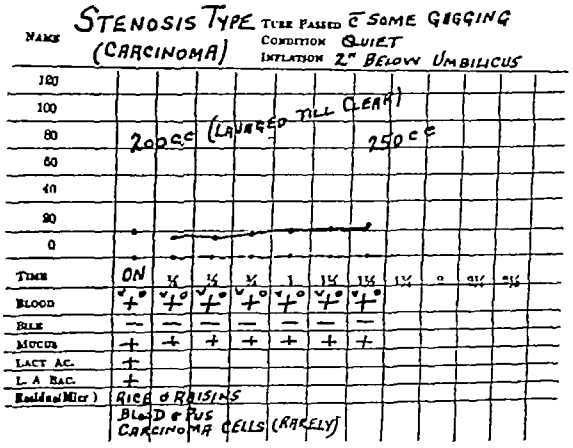

FIGURE 6

Secretion No free acid
Motility Overnight retention Large residue at end
Admixtures Blood in all specimens
In fasting contents Food remnants, lactic acid, lactic acid bacilli and carcinoma cells (rarely)

the finding of an empty stomach before this time (see Fig 3), would indicate a hypermotility, and is met with in achylia and quite frequently in duodenal ulcer It is also seen in cases in which the pylorus is held open abnormally by adhesions or infiltration A large residue, 150 cc. or more, is usually indicative of either pylorospasm or pyloric stenosis, although it may occur temporarily in atonic, ptosed stomachs

In severe pyloric stenosis, or in hour-glass constriction, we should find a large overnight residue, with gross rice and raisins or other food remnants present, and a large residue at the end of the analysis (See figures 5 and 6) The amount obtained at the end may be larger than the original 300 cc test meal, due to the addition of gastric juice In incomplete stenosis, rice and raisins

may be retained, but the thin test meal may be rapidly expelled

In pylorospasm the retention specimen would show no rice or raisins and would not be large in amount, but the residue at the end would be large, due to the temporary delay from the spasm (see Fig 2)

In some ways this functional test of motility is more valuable than the radiographic findings A six hour gastric retention of barium is not always indicative of pyloric stenosis, and even a twenty-four hour retention is often caused by a temporary dilatation associated with only partial narrowing due to irritation or edema caused by the patient's idiosyncrasy to milk or buttermilk The check-up by means of fractional analysis is invaluable in these cases

Admixtures

Bile is an admixture whose appearance should be waited for in every fractional gastric analysis Normally it occurs frequently in the overnight residue, and in the course of the gastric analysis it begins to be regurgitated into the stomach at the time when the pylorus is relaxed, toward the end of the period of examination—at one and one-half to two hours after the cracker and water meal and at three-quarters to one hour after the water meal It can be recognized by the fact that it stains the gastric contents yellow or green Its presence is of value in that it indicates that duodenal contents have been regurgitated and that the coincident appearance of other admixtures, such as blood, would almost surely indicate that their origin is in the duodenum The presence of bile would preclude the presence of a total pyloric stenosis, while its absence, except in cases of obstructive jaundice, might indicate either stenosis or severe and prolonged pylorospasm

Blood is an important admixture Its presence in the first and succeeding specimens removed might be due to swallowed blood from the mouth, upper air passages or esophagus, and is therefore of no positive diagnostic value so far as gastric bleeding is concerned Blood beginning to appear in the later specimens and becoming definitely visible in the specimens showing plainly the regurgitation of duodenal contents (bile stain), almost invariably indicates that its origin is in the duodenum (see Fig 4), and is most frequently due to duodenal ulcer, although it also occurs occasionally following an attack of gall-stone colic (trauma of common duct) and would be found in the rare cases of carcinoma involving the duodenum The blood from the raw surface of an ulcer has a characteristic appearance, occurring in the form of small distinct flakes giving very powerful occult blood reactions and showing more or less changed blood cells microscopically This coincident appearance of blood and bile is of the greatest diagnostic significance and has repeatedly been confirmed by the finding of duodenal ulcer at operation It is of particular value in the cases where the Roentgen Ray fails to differentiate between duodenal deformities due to ulcer and those due to gall-bladder adhesions, and in cases of partial pyloric stenosis in which the ulcer can thus be located in the pre- or post-pyloric region In complete pyloric stenosis the absence of blood would indicate a post-pyloric ulcer (see Fig 5)

The finding of occult blood only is not of as much value as the finding of visible blood, but we are beginning to feel that it may be indicative of a surface irritation due to an intense gastritis or duodenitis A diagnosis of this kind has been almost invariably confirmed by the Roentgen findings suggested by Eastmond, Rendich and others as being due to inflammation without ulceration

The absence of blood is also of much diagnostic value For instance, carcinoma of the stomach can almost be excluded when no blood is found, the cases of interstitial scirrhous carcinoma, not involving the mucosa and causing ulceration, being very rare It will aid in the differentiation between extrinsic and intrinsic stomach wall tumors The finding or absence of blood will also often help to distinguish between active and old healed ulcers, and is a valuable aid in determining the success of measures to stop active bleeding from peptic ulcers

Mucus and pus are most frequently of upper respiratory origin, although mucus is present in excess in chronic gastritis and mucopus in ulcerating carcinoma

In pyloric stenosis the microscopic study of the overnight residue is of further importance In benign stenosis, due to ulcer or adhesions, yeasts and sarcinae will be found, whereas in carcinoma, when achylia is present, lactic acid bacilli and giant cells may be present In the latter case, lactic acid will also be found chemically

Carcinoma cells are rarely recovered by the gastric tube, but where found their significance is obvious

Inflation

Inflation of the stomach with air through the gastric tube before its withdrawal is a simple procedure and is often a more reliable method of determining the size and position of the stomach than is the r-ray The heavy barium mixture often indicates apparent gastroptosis, when inflation shows the greater curvature to be well above the umbilicus, the lowest normal point Occasionally hour-glass stomach can be recognized visually by this method and palpable abdominal tumors may be localized by studying the way they disappear or are accentuated by the inflation

Clinical Data

The correlation of the different findings described previously is of the greatest aid in arriving at a diagnosis of gastro-intestinal conditions In the following diseases fractional gastric analysis offers much of diagnostic value.

In *gastro-duodenal ulcer* the findings may vary as follows In gastric ulcer the acid curve is not characteristic, but a high normal curve is frequently met with, in duodenal ulcer the reflex curve is the rule However, achylia is occasionally met with in both conditions, and when found associated with gastric ulcer brings up the suspicion that the ulcer may be malignant. The motility will vary with the location of the ulcer If near the pylorus, pylorospasm may result, causing delayed emptying without overnight residue, or the pylorus may become actually occluded, when the overnight residue of rice and raisins will be the important factor An ulcer of the body of the stomach will usually cause no motor disturbance, while one in the duodenum frequently produces a gastric hypermotility, as evidenced by early emptying of the stomach The significance of the appearance of blood in the gastric contents in ulcer cases has already been explained, blood in all specimens from the stomach being a necessary concomitant of active gastric ulcer, blood in regurgitated duodenal contents being practically characteristic of duodenal ulcer The presence or absence of blood may also help to decide the question of the activity or even the existence of ulcer where deformities of the stomach, duodenum or jejunum, either before or after operations, are seen by *x*-ray, but are often impossible of differentiation as between active ulcer, ulcer scar or adhesions Inflation will demonstrate the dilated stomach of pyloric stenosis, and often the constricted middle of the stomach in hour-glass narrowing

In *gall-bladder disease* the findings by gastric analysis would consist mainly of evidences of gastric and duodenal irritation or inflammation as manifested by a reflex continued secretion in the early stages and achylia later, by evidences of pylorospasm with delayed emptying and by the presence of occult blood from the pyloric and duodenal regions The passage of a gall-stone may also produce evidences of active bleeding into the duodenum

In *appendicitis,* less so in *colitis,* and again more prominently in proctitis and other causes of rectal symptoms, the gastric findings consist mainly of evidences of reflex irritation—the reflex acid curve and the delayed or hurried emptying of the stomach The same is true of cases in which there are gastric symptoms resulting from disorders of the pelvis or the genito-urinary tract In the later stages of all these conditions achylia may be found

Gastric carcinoma in its early stages and even in the advanced cases, does not always show the achylia so often described as characteristic In 25 per cent of our cases there was a normal or even heightened acid curve The motility findings vary—there may be normal or increased motility in carcinoma of the body of the stomach, increased motility where a carcinoma stiffens and keeps open the pyloric orifice, and evidences of obstruction where the carcinoma has occluded the lumen either as a result of its great size or its location in the pyloric ring Blood is a constant finding except in the rare instances where there is an infiltrating carcinoma not involving the mucosa The persistent finding of blood may often be a deciding factor in making a diagnosis of beginning recurrence of carcinoma after operation or radiation In pyloric obstruction with achylia, the finding of lactic acid and the Boas-Oppler bacilli is of interest, but it must be remembered that the combination of obstruction and achylia due to other causes than malignancy (syphilis, tuberculosis or simple adhesions) may also result in the growth of these bacilli On the rare occasions when fragments of carcinoma tissue are recovered on aspiration a definite pathologic diagnosis may be made by gastric analysis This occurs only in advanced cases, and it may yet be truly said that there is no early diagnosis of gastric carcinoma, if by early diagnosis is meant definite recognition of a carcinoma the cure of which is yet possible

Esophageal carcinoma has occasionally been recognized by the fact that it causes a delay in or obstruction to the passage of the tube into the stomach and that blood may be obtained from the region of the obstruction by aspiration or by examination of the tip of the tube after its removal Cardiospasm, if mild, may permit passage of the tube after some delay, and if severe, may prevent its passage entirely Absence of blood on the tip of the tube can not be taken as good evidence that malignancy does not exist

In *pernicious anemia,* the absence of free HCl in fractional gastric analysis following the administration of histamine has become a sine qua non in the diagnosis

In advanced *pulmonary tuberculosis* we have found that an achylia is usually present except in the cases where a peptic ulcer is co-existent, in which case the characteristic findings of this condition usually obtain The same holds true in most chronic wasting diseases

In *syphilis* no characteristic findings have been noted In the rare cases of gastric syphilis the findings may be those of either ulcer or malignancy, comparatively normal test meal findings associated with marked *x*-ray evidences of extensive indurative changes being supposedly very suggestive of syphilis

In our experience, endocrine disturbances, nervous influences and so-called visceroptosis are not often factors in causing abnormal findings by fractional gastric analysis

Summary

1 Single gastric analyses are of practically no diagnostic value

2 Fractional gastric analyses, especially where combined with the use of histamine as a secretory

stimulant and water as an index of motility, are of distinct value in the diagnosis of gastrointestinal conditions

3 Too much emphasis has been placed upon secretory findings and not enough on motor and incidental findings

4 A standard technique for fractional gastric analysis would be extremely valuable in order to correlate findings by different investigators

Discussion

Dr Irving Gray —The administration of a rice and raisin meal at night with an extraction the following morning has long been advocated as yielding important data of both motor and secretory function After the extraction of the fasting stomach, Histamin (¼ to ½ mg) is given hypodermatically and the patient is allowed to drink two glasses of water A gastric extraction is done every half hour or at the end of one hour and in those patients who have a marked sub or anacidity, fractional gastric analysis is usually carried out

We use Histamin routinely in the study of gastric secretion for it has been definitely proven to be a true stimulant of the gastric glands We have discontinued the use of crackers or bread in the study of gastric secretion because of the varying amounts of lactic acid present

Fractional gastric analysis yields so many types of normal curves that it is fallacious and rather dangerous to attempt to build a picture of gastric pathology on gastric secretory findings We reserved the use of fractional analysis for those patients who have a sub or anacidity

The importance of a standard technique which will be used routinely in all clinics will go a long way toward aiding in the interpretation of gastric secretory findings

HEALTH SERVICE IN SUFFOLK COUNTY

By ALLEN W FREEMAN, M D.,
Professor of Public Health Administration Johns Hopkins University, Baltimore, Md.

Abstract of an address before the Suffolk County Medical Society on October 31 1929 describing the results of a survey of the present state of health service in the county made by Dr Freeman in September 1929 on the invitation of the Suffolk County Medical Society —*Editor s Note*

THE survey of Suffolk County has been a very delightful and interesting experience, particularly in relation to the similar survey of the health service of Steuben County conducted last Spring The health service of Suffolk County is unique in that it came into being as a result largely of the initiative of this Suffolk County Medical Society, and expresses in a very real sense your own desire to give the people of the county an effective and modern health service In the course of the survey the physicians of the county have been most kind and helpful and have aided the work in every possible way For this helpfulness and courtesy I am deeply grateful

Before beginning a discussion of the present health service in Suffolk County, it might be wise to devote a few moments to a discussion of modern health service in general It must, first of all, be admitted that there is no existing standard of camparison Efforts have been made by various agencies, particularly by the American Public Health Association, to establish a standard, but in spite of these the subject must still be considered as in the phase of evolution and experiment

While this is true, we all have fairly definite notions as to what a public health service really should be No one questions the need for an effective program of prevention of communicable disease We have come, however, to recognize that the routine isolation and fumigation which made up our former program have only a limited effectiveness Communicable disease control depends upon careful study and upon the precise application of the exact measures necessary to the particular situation An important factor in the study of communicable disease in any area is the assembly in a single office of the reports and epidemiologic information for all cases, in order that general sources of infection may be recognized and particular conditions promptly met The importance of immunization in a modern program of communicable disease prevention is too well known to need emphasis

We all recognize, likewise, the importance of environmental sanitation in the promotion of general health It was during the period of maximum activity in environmental sanitation that the greatest gains in reduction of mortality were made, and no health service can afford to neglect sanitation

Modern public health, however, has added to these historic conceptions of the subject a new conception, that of continuous medical supervision for health The growth of this conception has been so gradual that it is only now that its full implications are beginning to be understood Starting with the prevention of infant mortality, it was found that

In *gastro-duodenal ulcer* the findings may vary as follows In gastric ulcer the acid curve is not characteristic, but a high normal curve is frequently met with, in duodenal ulcer the reflex curve is the rule However, achylia is occasionally met with in both conditions, and when found associated with gastric ulcer brings up the suspicion that the ulcer may be malignant. The motility will vary with the location of the ulcer If near the pylorus, pylorospasm may result, causing delayed emptying without overnight residue, or the pylorus may become actually occluded, when the overnight residue of rice and raisins will be the important factor An ulcer of the body of the stomach will usually cause no motor disturbance, while one in the duodenum frequently produces a gastric hypermotility, as evidenced by early emptying of the stomach The significance of the appearance of blood in the gastric contents in ulcer cases has already been explained, blood in all specimens from the stomach being a necessary concomitant of active gastric ulcer, blood in regurgitated duodenal contents being practically characteristic of duodenal ulcer The presence or absence of blood may also help to decide the question of the activity or even the existence of ulcer where deformities of the stomach, duodenum or jejunum, either before or after operations, are seen by x-ray, but are often impossible of differentiation as between active ulcer, ulcer scar or adhesions Inflation will demonstrate the dilated stomach of pyloric stenosis, and often the constricted middle of the stomach in hour-glass narrowing

In *gall-bladder disease* the findings by gastric analysis would consist mainly of evidences of gastric and duodenal irritation or inflammation as manifested by a reflex continued secretion in the early stages and achylia later, by evidences of pylorospasm with delayed emptying and by the presence of occult blood from the pyloric and duodenal regions The passage of a gall-stone may also produce evidences of active bleeding into the duodenum

In *appendicitis,* less so in *colitis,* and again more prominently in proctitis and other causes of rectal symptoms, the gastric findings consist mainly of evidences of reflex irritation—the reflex acid curve and the delayed or hurried emptying of the stomach The same is true of cases in which there are gastric symptoms resulting from disorders of the pelvis or the genito-urinary tract In the later stages of all these conditions achylia may be found

Gastric carcinoma in its early stages and even in the advanced cases, does not always show the achylia so often described as characteristic In 25 per cent of our cases there was a normal or even heightened acid curve The motility findings vary—there may be normal or increased motility in carcinoma of the body of the stomach, increased motility where a carcinoma stiffens and keeps open the pyloric orifice, and evidences of obstruction where the carcinoma has occluded the lumen either as a result of its great size or its location in the pyloric ring Blood is a constant finding except in the rare instances where there is an infiltrating carcinoma not involving the mucosa The persistent finding of blood may often be a deciding factor in making a diagnosis of beginning recurrence of carcinoma after operation or radiation In pyloric obstruction with achylia, the finding of lactic acid and the Boas-Oppler bacilli is of interest, but it must be remembered that the combination of obstruction and achylia due to other causes than malignancy (syphilis, tuberculosis or simple adhesions) may also result in the growth of these bacilli On the rare occasions when fragments of carcinoma tissue are recovered on aspiration a definite pathologic diagnosis may be made by gastric analysis This occurs only in advanced cases, and it may yet be truly said that there is no early diagnosis of gastric carcinoma, if by early diagnosis is meant definite recognition of a carcinoma the cure of which is yet possible.

Esophageal carcinoma has occasionally been recognized by the fact that it causes a delay in or obstruction to the passage of the tube into the stomach and that blood may be obtained from the region of the obstruction by aspiration or by examination of the tip of the tube after its removal. Cardiospasm, if mild, may permit passage of the tube after some delay, and if severe, may prevent its passage entirely Absence of blood on the tip of the tube can not be taken as good evidence that malignancy does not exist

In *pernicious anemia,* the absence of free HCl in fractional gastric analysis following the administration of histamine has become a sine qua non in the diagnosis

In advanced *pulmonary tuberculosis* we have found that an achylia is usually present except in the cases where a peptic ulcer is co-existent, in which case the characteristic findings of this condition usually obtain The same holds true in most chronic wasting diseases

In *syphilis* no characteristic findings have been noted In the rare cases of gastric syphilis the findings may be those of either ulcer or malignancy, comparatively normal test meal findings associated with marked x-ray evidences of extensive indurative changes being supposedly very suggestive of syphilis

In our experience, endocrine disturbances, nervous influences and so-called visceroptosis are not often factors in causing abnormal findings by fractional gastric analysis

Summary

1 Single gastric analyses are of practically no diagnostic value

2 Fractional gastric analyses, especially where combined with the use of histamine as a secretory

into account, apparently, at the expense of efficiency In some cases good work is being done, and in some cases very poor work is in evidence

The picture of the school nursing service as it now exists in the county is one of unfulfilled promise There are now in Suffolk County 25 school nurses employed by the school boards and the towns As is the case with the school physicians, there is no organization, no supervision, and no attempt at standardization of the work of these nurses Some are well trained and are doing excellent work Some are very poorly trained and are doing poor work, and all gradations between these two extremes may be seen It is not too much to say that enough money is now being spent in Suffolk County on the school service to provide a comprehensive, efficient, and satisfactory system, but that the present decentralization of the work, the absence of organization and supervision, results in a service which cannot be classed as even reasonably satisfactory This problem may readily be solved through the agency of the County Health Department, though its ultimate solution may perhaps demand some amendment to existing state law

Unfortunate as are conditions in connection with school medical inspection, an additional handicap is found in the absence of organized facilities for the correction of the large number of defects discovered by the present system Under present conditions, each individual case constitutes a separate problem to the nurse, and an enormous amount of time and energy is expended in trying to provide for individual cases, when a suitable organization could readily be devised for the solution of the various problems as a whole

Here again there is need for constructive activity by the organized medical profession It is the physicians who must in the last analysis render the service It is surely not too much to ask that they recognize the fact that the problem is one of wholesale rather than of retail distribution of medical service, and attack it from that standpoint

It would be impossible to conclude these remarks without a comment on the tuberculosis service Beginning with the opening of the county Sanatorium in 1916, there has been developed a service of case-finding and treatment which is in my opinion more efficient and more nearly complete than any it has been my privilege to observe previously By close cooperation with practicing physicians, by the energetic and efficient nursing follow-up, sources of infection in tuberculosis have been discovered and treatment provided in a wonderfully satisfactory and at the same time economical fashion Too much credit cannot be given to Doctor Kolb, and to the nurses for this piece of work

It should not be inferred from what has been said, in spite of the critical tone of most of these remarks, that Suffolk County is backward in its health administration On the contrary, it has made splendid progress, and even under present conditions its health service is excelled by but a few rural counties in the United States The purpose of this survey, however, is to give a picture of the possibilities which lie before the health organization and the physicians of the county, and it is from this point of view that these remarks have been made Suffolk County has made magnificent progress, and it has before it the possibility of developing, without additional large expenditures, a health service which will be second to none in the United States In this development, however, it is absolutely essential that there be the closest possible interlocking between the work of the medical profession and the work of the health organization The problems remaining for solution can be solved by neither organization separately They can be solved without difficulty by joint action

This Suffolk County Medical Society responsible as it is for the establishment of the new health organization, has an opportunity to contribute toward the solution of some of the most difficult, and at the same time most important problems now confronting organized medicine in the United States

---

THE TOXEMIAS OF PREGNANCY*

By JOHN OSBORN POLAK M D, BROOKLYN, N Y

WHEN we consider that 29 per cent of our stillbirths and macerates are the result of toxemia and that 27 per cent or more of the women who die during pregnancy or in childbed die from toxemia, convulsions or their sequellae, it is evident that there is no uniform teaching on this subject, and that too much surgery is being done on a medically sick patient It is, therefore, my purpose to consider the known clinical facts in hyperemesis, preeclampsia pregnancy occurring in the nephritic woman and in eclampsia with its convulsive explosions, in order that the practitioner may better understand the present status of this baffling sub-

* Read at the Annual Meeting of the Medical Society of the State of New York at Utica N Y June 5 1929

improvement of milk supplies alone was not effective in reducing the excessive death rate of infants Even the visiting nurse working in the home as an agent of instruction was not able to produce the best results Only when the infant welfare clinic was evolved and the habit established of bringing infants regularly for examination and advice by a physician, did the real decline in infant mortality begin

It is of interest that this decline has been observed in the class of population whose economic and social status was least favorable to hygienic living The children of the poor have been saved by substituting for the traditional curative service of the physician a continuous preventive service

The same thing was found to be true of the children in the schools Great benefit was realized from having school children seen regularly by a physician for examination and advice, and for recommendation as to the correction of defects The principle is the same The school child does best under continuous supervision by a physician rather than when seen only during periods of illness Health services in colleges and universities, health service in industry, and the so-called life extension work or periodic examination of adults, are all only an extension of this simple principle of continuous medical supervision for health

In the prevention of maternal mortality and of neonatal mortality, the same technique was developed and its usefulness is clearly demonstrated We may say, therefore, that the public health of today involves, in addition to the traditional functions of communicable disease control and environmental sanitation, the establishment and operation of a system of medical supervision for health beginning shortly after conception, and extending throughout life

Turning now to an examination of conditions in Suffolk County, we find that the county organization as at present constituted is in the way of solving in a most satisfactory and efficient manner the problems of communicable disease control and of environmental sanitation The prompt reporting of cases of communicable disease, the study in the office of the County Health Department of the reports and epidemiologic records from the whole county, the existence of trained personnel, offer a guarantee of the best possible service of this sort

In environmental sanitation your County Health Department has elaborated a program which promises the greatest possible usefulness to the county The problems of water supply and sewerage, already acute in some parts of the county, are becoming more pressing each year, and upon their solution in a large and statesmanlike way, much of the future growth and prosperity of the county will depend The establishment of the office of county sanitary engineer is a recognition of the importance of these problems

Of great importance, likewise, is the successful beginning of the work of dairy inspection and of the control of pasteurizing plants in Suffolk County, reported on this morning, in ensuring to the people of the county a safe and clean milk supply The attachment to the County Health Department of the work of eradication of tuberculosis in cattle is likewise a most happy circumstance, and will undoubtedly contribute both to the success of that particular work and to the popularization of health activity in the county at large We may say, therefore, that in communicable disease control and in environmental sanitation the road is clear before you, and there is every prospect of fruitful development

In maternal and infant hygiene, the program in Suffolk County is still to be developed The returns made by the practicing physicians of the county would seem to indicate that prenatal care is coming to be recognized as a routine and essential part of obstetrics, and that maternal hygiene, except for the very small class of the indigent population, is in fair way of solution In the setting up and operation of a system of infant health supervision, however, no such progress is observable Only a few physicians report that any considerable part of the infants under their charge are brought to them regularly for examination and advice, and only a small start has been made in part of the county in the inauguration of an organized infant welfare service A great opportunity confronts the health department of Suffolk County in the solution of this problem in a manner which will safeguard the rights of the private practitioner, preserve and strengthen the bonds between the individual and his own physician and at the same time ensure to every infant born in Suffolk County continuous and effective medical supervision from birth to the time of entrance into school

The school health service of the county presents a most interesting and in some ways depressing picture The present law requiring the annual medical examination of the school children has been in force some sixteen years and a large amount of energy and money has been expended in attempting to comply with its provisions Under the system prevailing, however, there is no supervision of the work no standard procedure, and no reasonable scale of compensation Each school trustee or board of education makes the best bargain it can with a physician Cheapness is often taken

These general principles should be supplemented with rest in bed after meals, and the internal administration of small doses of thyroid extract. Should the vomiting persist and the patient lose weight, rest in bed *with absolute isolation is to be insisted upon,* and the fluid loss made up by hypodermoclysis, enteroclysis and the intravenous injection of glucose solutions amounting to 1,000 c.c. daily of 10 per cent solution until diuresis is produced.

In 1924 and 1925 Thalhimer extended his treatment of post-operative non-diabetic acidosis to include cases of toxic vomiting of pregnancy Briefly, the method consisted in the intravenous administration of about 1,000 c c of warm 10 per cent glucose solution at the rate of from 200 to 300 c.c an hour. In addition, fifteen minutes after the injection has been begun, 10 insulin units are given hypodermically More insulin is given at intervals of an hour, until 30 units to the thousand cubic centimeters of glucose solution have been given

Although Thalhimer gave due credit to Titus, Hoffman and Givens, and to Duncan and Harding, who had administered glucose alone in cases of this sort, his method of combining insulin with glucose has not given better results than did glucose alone If this treatment is successful, the pulse will become slower and fuller, the blood pressure will rise, the urinary output will be increased, and the vomiting will diminish or cease altogether

When glucose alone or in combination with insulin fails to produce this improvement, I have employed transfusions of 300 c.c of human blood by the direct method, to which is added 500 c c of physiologic sodium chloride solution The success of these procedures has been so satisfactory that I have not had to empty the uterus for vomiting in a period of nearly seven years It must, however, be impressed on the attendant that if, under this plan of treatment properly carried out for a period of a week, diuresis is not produced and the vomiting continues, the uterus should be emptied As soon as vomiting ceases, the patient should be given solid food with a high carbohydrate content Should no improvement take place after transfusion, the uterus should be emptied under morphine-scopolamine narcosis

Pre-Eclamptic Toxemias

The situation in pre-eclamptic toxemias is not the same as in pernicious vomiting except that they both occur in pregnant women and that in fatal cases the liver is always seriously involved

In the study by Herrick at the Sloan Hospital where every toxemia of the latter months is studied by the internist as well as by the biochemist and the obstetrician, they have come to the conclusion that the woman who develops a pre-eclamptic toxemia or an eclampsia is the woman who starts on her pregnancy with defective emunctories or an unbalanced endocrine system It is the result of a dysfunction and improper correlation of the eliminative system, and of endocrine control in the individual woman My own study tends to confirm this theory, which has a definite clinical backing Therefore, the real clinical questions in toxemia are what physical type of woman breaks down under the strain of pregnancy? What pathological changes does she show before and during pregnancy, and what pathology remains after the so-called recovery? Women with persistent systolic pressures of 150 and diastolic pressures above 100 at the beginning of pregnancy are not likely to go through pregnancy successfully A pressure of 140 may be considered hypertension in pregnancy, for the normal pregnant woman has a characteristic arterial hypotension The late toxemias of pregnancy represent failure of a defective maternal cardiovascular renal system to adapt itself to the strain of childbearing This is subsequently shown by cardiovascular renal changes evidenced by albuminuria, nitrogen (non-protein) retention

Eclampsia is not due to any specialized toxin or toxins elaborated by the growing fetus or its appendages combined with failure on the part of the mother to develop an anti-toxin, but rather to the overload suddenly placed on the maternal organism for the pregnant woman shows a condition of rapid growth and a rapid increase in weight superimposed on an adult organism that has ceased to grow It is only natural, therefore that metabolic strains are set up in the mother to meet the demands of the fetus This results in a disturbance of metabolic balance, which in turn affects hepatic and kidney function, for it is well known that eclamptic disturbances which characterize the latter half of pregnancy occur at a period of rapid fetal growth which needs an increasing quantity of glucose to maintain it This in a way confirms the low sugar content of the blood in pregnant women, as well as the increase in the uric acid content of the later weeks

Repeated studies of the blood chemistry in pre-eclamptic toxemias show nothing that is significant or characteristic except that when the blood is found to have a decided nitrogen retention either in the form of non-protein nitrogen or in uric acid, it may be assumed that nephritis is the predominating factor in the toxemia.

I had expected to find that the basal metabolism rate would be materially changed in the pregnant woman, and be available as a diagnostic sign of some value in the pre-eclamptic toxemias, but studies of the readings at different periods of pregnancy have proved that the woman who is functionally fully equipped and healthy in the early months has practically no change in her metabolic readings, and that there is slight though definite elevation of the basal rate in the latter half, returning to the normal after a few days of the puerperium

ject It may be said that pregnancy is the great efficiency test of the workings of the maternal organism, for the fetus and the uterus in their growth and development call for such adaptative changes in all the important organs of the mother, that unless there is perfect and harmonious efficiency on the part of all the organs called upon in this process, the load cannot be carried The pituitary, thyroid and parathyroids become activated, ovulation ceases and more work is demanded by the liver, kidneys, lungs and heart Therefore, it is easy to deduce that incompetence on the part of any organ must shift the load to others, with resulting defect in the body metabolism

The toxemias of pregnancy present the most striking examples of maternal maladaptation to the needs of the fetus and fetal growth The very fact that nausea and vomiting of greater or less degree occur in more than 50 per cent of pregnant women may be considered as inevitable evidence that there is a temporary disturbance of the physiologic balance This has been accounted for by the relative carbohydrate deficiency due to the unexpected demand for glycogen on the part of the fetus, and to the actual deficiency occasioned by the nausea, vomiting and the consequent lessened intake

With these facts demonstrated it takes but little imagination to appreciate that by lack of care, marital indiscretions, improper hygiene and dietetics, this vomiting which is so common in the early months may be aggravated to a degree which will take large quantities of fluid out of the body tissues, resulting in dehydration The actual fluid loss from emesis in patients who have had no fluid intake by os varies between 1,000 and 2,000 c c per diem Such a fluid loss repeated day after day quickly dehydrates the woman and produces the clinical picture of dehydration which is so familiar to you all The rapid emaciation, the dry coated tongue, dry, cracked lips, increasing pulse rate, diminished urinary output and lowered blood pressure Rapid emaciation is further augmented by starvation, and we find the following clinical phenomena result The blood pressure is lowered, the pulse gradually increases in rapidity, the urinary output is diminished, while there is a concentration of the body fluids and an increase in the carbohydrate deficiency as more and more glycogen is abstracted from the liver in order to carry on life Together with these signs the leukocyte count is usually diminished and an icteric hue tinges the conjunctiva

It may, therefore, be seen that the pathology found in the liver and kidneys is a result of a retention of toxic products consequent upon the dehydration and the glycogen deficiency Certainly the final pathology in the liver is identical with that found in patients dying of starvation This deduction is supported by the fact of the rapid subsidence of hepatic and renal symptoms when the uterus is emptied or when diuresis is produced

Mundell studied the blood in a series of 52 normal pregnant women at the different months of pregnancy, beginning with the second and ending with the ninth This study shows conclusively that there is very little actual change in the blood chemistry except in the non-protein nitrogen and uric acid contents The normal blood seldom contains more than 3 mg of uric acid to 100 c c, while the non-protein nitrogen rarely exceeds 30 mg In excessive vomiting, dehydration and rapid emaciation, the uric acid reaction is always slightly increased Another significant point is that the blood sugar maintains its normal ratio in the pregnant woman until about the end of the third month or about the time when placentation takes place, at which period we note a sharp drop in the sugar content, while toward the end of the fourth month and the beginning of the fifth the ratio seems to be re-established on a normal basis This points to a disturbance in the carbohydrate fat ratio as the basic factor in this disease It is on the acceptance of these facts that the adoption of the suggestions of Harding and Titus have proved their clinical value The intravenous use of large quantities of a properly prepared glucose solution replaces the sugar deficiency and allows the proper functioning of the liver to carry on.

Roger, Davis and Whipple have shown that starved animals are especially susceptible to liver injury, while by increasing the carbohydrate intake the liver resistance is increased

At the research laboratory of the University of Minnesota liver tolerance has been most exhaustively studied It has been found that it is possible to remove four of the seven lobes of a dog's liver, and by giving such an animal daily injections of a glucose solution, his health will be in no way impaired On the other hand, if no glucose is given, his susceptibility to injury, dietary indiscretions or exertion is very manifest

In mild cases of early vomiting the patient should be impressed with the necessity of revamping her mode of life, her dietetics and her hygiene Perhaps the most important of these is her sex hygiene—it is imperative that marital abstinence *be insisted upon*, that malpositions of the *pelvic organs be corrected*, that the constipation be relieved—and in addition to these fundamentals, that the amount of carbohydrate as well as fluid intake be increased to the point of greatest tolerance The copious ingestion of water should be encouraged—usually in the form of a bland or alkaline water (Poland, Kalax or Celestin vichy) *At least two quarts of water daily must be taken* To meet the carbohydrate deficiency we insist upon an increased intake of carbohydrates in the form of cereal, fruit, fruit juices with sugar, puddings, chocolate or candy

limited to just enough to sustain life, milk and fruit juices with sugar make up the foundation of her diet Stimulation of her emunctories should be done by producing diuresis This may be done with water and the intravenous use of glucose solutions, except in the cases of edema, when the intake of fluids should be restricted and diuresis stimulated by lumbar cupping, ammonium chloride and calcium chloride The skin must always be kept active This effect may be secured by having the woman rest between blankets or with the electric baker To favor surface relaxation the nitrites will add to its efficiency When no improvement is shown, pregnancy must be terminated, depending upon the existing obstetric condition, always keeping in mind that the toxic patient is a poor surgical risk, bearing anesthesia poorly, liable to shock, and more susceptible to infection than her better equipped sister Haste and trauma must be avoided In the presence of convulsions the indications are never surgical With the appearance of the first convulsion, the woman should be given (hypodermically) one-fourth grain (16 mg) of morphine sulphate, placed in bed in the Trendelenburg posture, and turned on the side to allow the mucus to drool from the mouth. The tongue must be protected by a gag, the bladder is emptied by catheterization If the pressure is 150 or more, 1000 c c of blood should be withdrawn This may be replaced by 500 c c of a 10 per cent glucose solution The morphine is repeated in an hour—and nothing else is done unless the convulsions recur and the supervening coma increases to a degree that the patient remains comatose between convulsions, this condition is an indication for the intravenous use of magnesium sulphate in quantities of 10 c c of a 25 per cent solution, which has had a most kindly effect, diminishing the cerebral edema and controlling the occurrence of subsequent convulsions

The management of labor in the presence of eclamptic convulsions is based on the three principles of (1) Avoiding trauma, (2) preventing infection, and (3) diminishing the shock—for the eclamptic patient is a very poor surgical risk

My plan has been to disregard the labor until complete dilatation of the cervix is obtained, when, if the head is engaged and at the spines, delivery may be expedited by the use of low forceps under light oxygen-ether narcosis added to the morphine analgesia

Section has been limited to those cases in which there was a definite obstetric indication, and not employed as a routine for rapid delivery My experience shows that prevention is the keynote of success the toxic patient needs active treatment with the first appearance of hypertension, convulsions may be prevented by induction of labor when medical means fail to reduce tension and produce diuresis, and the treatment of eclampsia is essentially medical, and surgical delivery has only a limited field

In the pre-eclamptic state the readings are slightly higher than normal, this, however, is demonstrated only in the severe conditions There is little or no difference in the patients with and without a pre-existing kidney lesion, so that antepartum differentiation cannot be made by this test However, in the nephritic type the reading is apt to remain higher for some time after delivery, which in a way coincides with the blood pressure readings, therefore it may be concluded that neither blood chemistry nor metabolic rate throws much light on the etiology or prognosis Furthermore, the clinical manifestations, those that may be observed by any keen practitioner, are of greater significance

Diagnosis

The pre-eclamptic toxemias are usually considered under

1 The hepatic type, which is commonly of sudden development, with a nephrosis as the kidney lesion, without any pre-existing history of renal disease

2 The renal type, in which nephritis is a contributing etiologic factor The clinical distinction between these two types in antepartum toxemia is difficult to make, though in the former there is no previous history of renal disease, while in the latter there is always some clinical evidence of pre-existing kidney lesions However, after the labor is terminated, the hepatic type is shown by the relatively quick return of the blood pressure and kidney function to normal, while in the renal type it may take months to clear the urine of albumin and casts, and the blood pressure never ranges below 140

The earliest evidences of toxemia are

1 A rise in the systolic blood pressure

2 The appearance of an albuminuria coincident with or appearing soon after the occurrence of hypertension

3 Diminished urinary output—the quantity of urine eliminated falling below 1,000 c c

4 An increase in the body weight beyond the normal 25 pounds (11 kg)

5 The appearance of edema in the face, hands and feet

6 Constipation associated with "heartburn" and epigastric distress

7 Frontal headache

8 Eye symptoms, ranging from spots before the eyes to amaurosis

Blood Pressure

The pregnant woman whose kidneys are healthy at the time of conception carries a hypotension seldom rising above 120 Progressive readings above this point demand watching Increasing hypertension during the course of pregnancy at any age points toward the onset of toxic symptoms Rise in pressure usually precedes the appearance of albumin by days or weeks, unless there is a pre-existing kidney lesion Coincident with the occurrence of albumin there may be a diminution in the urinary output with or without increased concentration

Weight

The pregnant woman normally increases her weight by about 20 to 25 pounds (9 to 11 kg) in the course of pregnancy The greater part of this increase takes place during the last four months Rapid increase is always dangerous—less so when associated with edema, for edema seems to be a salutary and conservative process which takes the toxins out of the blood and deposits them in the tissues Eclamptic explosions are less liable to occur when there is edema, especially when the edema forms slowly, than when it is of rapid appearance

Headaches

Frontal headache is one of the later manifestations of toxemia, sometimes the earliest forerunner of a convulsion Headaches should always be inquired into They are more common in the nephritic type Gastric acidity with pain or burning of the epigastrium is another evidence of toxemia which gives warning of impending danger

Eye

Eye symptoms are common in the nephritic type, the fundal and retinal changes having the same appearance as are found in glomerular nephritis They are usually absent in the fulminating type except for increased tortuosity high arterial light reflex and increased spasticity Occasionally exudate may be present

Treatment

The treatment of the pre-eclamptic state and of eclampsia is essentially medical The obstetric problem comes in for consideration only when labor is established by the convulsive seizures Notwithstanding the fact that convulsions cease in 52 per cent of the cases when the uterus is empty, we are not justified by the results in any extensive series of clinical observations in making delivery the first consideration in view of the poor surgical risk Naturally, the treatment of the latter months' toxemias resolves itself into

1 Prevention One of the greatest strides in preventive medicine has been the antepartum care given to the pregnant woman It has resulted, in many clinics, in the passing of eclampsia

2 The control of the convulsion

3 The management of labor in the presence of convulsions when labor has started

The pre-eclamptic toxic patient should be in bed She should have her nitrogenous intake

THE CORTLAND COUNTY HEALTH UNIT

The establishment of the County Health Department by the Board of Supervisors of Cortland County illustrates the results which may be expected when the medical profession of a county assumes the leadership in providing all practical forms of medical service in that county

The campaign for a health department of Cortland County was initiated over three years ago by the physicians, but in the uncertainty of that time regarding the kind of health department that the counties of New York State need, the doctors permitted the leadership in the campaign to pass to the lay health organizations While there was no antagonism between the two groups, there was a lack of close harmony of planning and action Popular sentiment seemed favorable to the establishment of a county health unit, but before it could be established, two questions had to be decided with a considerable degree of unanimity

1 The organization and extent of the proposed department

2 Its annual budget

A decision in Cortland County was delayed for a year or two, when the physicians again took up the matter in the Fall of 1929 Two precedents of county health units were then available to the Board of Supervisors to aid them in their determination of the need and extent of their own unit. One precedent was the unit of Cattaraugus County which includes all of the county outside of the city of Olean, and which has been in operation for six years The other was the unit composed of all of Suffolk County which has been in operation nearly a year

The lay organizations of Cortland County took Cattaraugus County as their model This unit was established and financed by an endowed organization from New York City for the purpost of demonstrating how a county health department could be run with the methods used in large cities Its budget was about $150,000 annually, and it had over twenty full-time workers on its pay roll On the other hand the physicians of Cattaraugus County were by no means unanimous in their support of the County Health Department

The plan of the Health Unit of Suffolk County was favored by the doctors of Cortland County This plan called for a budget of $25,000 annually, and a minimum of personnel with the expectation of expansion as the work developed, and the health needs and demands of the County became apparent

This was the situation when Dr W H Ross, representing the Public Relations Committee of the Medical Society of the State of New York, accepted an invitation from the Cortland County Medical Society to address the doctors on the Suffolk County plan and the attitude of the Committee on Public Relations Doctor Ross told the physicians that the plan of Suffolk County in which the Medical Society assumed the leadership in the campaign for the establishment of a county unit was fully endorsed by the Committee on Public Relations, and in fact was the only procedure recommended by the Committee Doctor Ross also informed the doctors that whatever plan was adopted, the physicians would have to bear the burden of carrying out the application of immunizations, the examinations at child welfare clinics, and all other health activities, and he advised the doctors that they should assume the responsibility for leadership at the very outset, and present a definite plan of organization to the Board of Supervisors The Cortland County physicians accepted this responsibility, and agreed that a county health unit was necessary

Doctor Ross then took up the plan and budget of a unit for Cortland County He advised that Cortland County should follow the example of Suffolk County in planning for a minimum personnel consisting of a county health officer, a supervising nurse, a clerk, and a milk inspector, together with means of transportation throughout the County He suggested that the budget of $25,000 would be ample, as it had been in Suffolk County This plan of organization was approved

On the day following the medical meeting the physicians presented their plans and estimates to the Board of Supervisors, which almost at once voted to establish the Department for Cortland County

The orderly and harmonious action in Cortland County has fully justified the eight points of agreement made by the Medical Society of the State of New York and the representatives of the leading lay health organization of the State after a controversy over the plans of the Cattaraugus County Health Unit (see this Journal, Dec 1, 1928, page 1433 When these agreements were made the physicians had not yet realized their own importance in public health administration nor were the lay health organizations aware of the latent possibilities of action by the medical profession But two years accomplishes much in any medical line, and physicians are now generally aware of their responsibility for leadership and cooperation in all lines of public health work. Now that the two counties have established health departments by the initiative and influence of the physicians, the way is open for other counties to establish similar units

NEW YORK STATE JOURNAL OF MEDICINE

THE YEAR'S RECORD

This number completes the twenty-ninth year of the publication of the activities of the Medical Society of the State of New York in its own JOURNAL The record for the year is one of increasing speed in the realization of ideals of practice which were only vaguely foreseen when this JOURNAL was first issued It is scarcely five years since the practice of medicine by medical societies has developed to such an extent that it enables individual doctors to discharge the civic duties which devolve upon the medical Profession

The promotion of the great fundamental principles of human relations is fostered by civic organizations—morals by churches, economics by chambers of commerce, and social progress by women's clubs All that pertains to health is within the field of the medical societies of the State and Counties, and their increased cultivation of that field during the past year has characterized the Medical Society of the State of New York, its District Branches, and its constituent County Medical Societies

THE CORTLAND COUNTY HEALTH UNIT

The establishment of the County Health Department by the Board of Supervisors of Cortland County illustrates the results which may be expected when the medical profession of a county assumes the leadership in providing all practical forms of medical service in that county

The campaign for a health department of Cortland County was initiated over three years ago by the physicians, but in the uncertainty of that time regarding the kind of health department that the counties of New York State need, the doctors permitted the leadership in the campaign to pass to the lay health organizations While there was no antagonism between the two groups, there was a lack of close harmony of planning and action Popular sentiment seemed favorable to the establishment of a county health unit, but before it could be established, two questions had to be decided with a considerable degree of unanimity

1 The organization and extent of the proposed department

2 Its annual budget.

A decision in Cortland County was delayed for a year or two, when the physicians again took up the matter in the Fall of 1929 Two precedents of county health units were then available to the Board of Supervisors to aid them in their determination of the need and extent of their own unit One precedent was the unit of Cattaraugus County which includes all of the county outside of the city of Olean, and which has been in operation for six years The other was the unit composed of all of Suffolk County which has been in operation nearly a year

The lay organizations of Cortland County took Cattaraugus County as their model This unit was established and financed by an endowed organization from New York City for the purpost of demonstrating how a county health department could be run with the methods used in large cities Its budget was about $150,000 annually, and it had over twenty full-time workers on its pay roll On the other hand the physicians of Cattaraugus County were by no means unanimous in their support of the County Health Department

The plan of the Health Unit of Suffolk County was favored by the doctors of Cortland County This plan called for a budget of $25,000 annually, and a minimum of personnel with the expectation of expansion as the work developed, and the health needs and demands of the County became apparent.

This was the situation when Dr W H Ross, representing the Public Relations Committee of the Medical Society of the State of New York, accepted an invitation from the Cortland County Medical Society to address the doctors on the Suffolk County plan and the attitude of the Committee on Public Relations Doctor Ross told the physicians that the plan of Suffolk County in which the Medical Society assumed the leadership in the campaign for the establishment of a county unit was fully endorsed by the Committee on Public Relations, and in fact was the only procedure recommended by the Committee Doctor Ross also informed the doctors that whatever plan was adopted, the physicians would have to bear the burden of carrying out the application of immunizations, the examinations at child welfare clinics, and all other health activities, and he advised the doctors that they should assume the responsibility for leadership at the very outset, and present a definite plan of organization to the Board of Supervisors The Cortland County physicians accepted this responsibility, and agreed that a county health unit was necessary

Doctor Ross then took up the plan and budget of a unit for Cortland County He advised that Cortland County should follow the example of Suffolk County in planning for a minimum personnel consisting of a county health officer a supervising nurse, a clerk, and a milk inspector, together with means of transportation throughout the County He suggested that the budget of $25,000 would be ample, as it had been in Suffolk County This plan of organization was approved.

On the day following the medical meeting the physicians presented their plans and estimates to the Board of Supervisors, which almost at once voted to establish the Department for Cortland County

The orderly and harmonious action in Cortland County has fully justified the eight points of agreement made by the Medical Society of the State of New York and the representatives of the leading lay health organization of the State after a controversy over the plans of the Cattaraugus County Health Unit (see this Journal, Dec. 1, 1928, page 1433 When these agreements were made the physicians had not yet realized their own importance in public health administration nor were the lay health organizations aware of the latent possibilities of action by the medical profession But two years accomplishes much in any medical line, and physicians are now generally aware of their responsibility for leadership and cooperation in all lines of public health work. Now that the two counties have established health departments by the initiative and influence of the physicians the way is open for other counties to establish similar units

THE 1929 INDEX

This number of our JOURNAL contains the annual index, whose plan is based on the experience of the editors Ninety per cent of the inquiries for articles in past numbers of the JOURNAL are for the activities of medical societies of the State and Counties The editors have frequently called attention to the fact that literature on the discharge of civic duties by practicing physicians is found almost exclusively in the Journals of the States Yet this literature is largely unnoticed and unrecognized, and its items are seldom quoted

Is the neglect of the literature on the practice of medicine by the medical societies of the States and Counties due to the lack of activities worthy of recognition? This cannot be true, for the editors of this JOURNAL have no difficulty in abstracting records from other Journals sufficient to fill at least six pages of each issue of our JOURNAL, or one hundred and fifty pages annually Suppose a doctor wants to find out what the medical societies of New York and other States are doing in Workmen's Compensation, where would he look for an index of the literature? He would look in the Journals which are the organs of those societies

Last year the editors of this JOURNAL prepared a special index of society activities recorded in the JOURNAL, and it filled over one-third of the space devoted to the index, but that part of the index was consulted far more than all the rest This year's index is departmented and cross-referenced on the same plan that was proved to be successful last year

ADVERTISER'S COUPONS

Editing advertising copy and making up the pages of a journal are subject to all the difficulties of arranging scientific articles,—and more Advertisers sometimes pay for particular locations in the journal, such as facing the first or last reading, or next to a column of general reading matter inserted in the advertising pages Yet mistakes sometimes occur For example, advertising pages xvii and xviii of our issue of December first carry announcements of codliver oil sold by rival firms, the E L Patch Company, and the Tailby-Nason Company It happens that the coupons for securing samples of these competing companies were printed exactly back to back, so that a doctor applying for a sample, also sent an application for a sample of the competing company

President Roosevelt often made the remark that he would excuse a man for making a mistake once, but not for its repetition This is our editorial attitude

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Malpractice History repeats itself in the practice of medicine This JOURNAL of December, 1904, describing a malpractice suit said

"A case of malpractice brought against a member of the Association will be tried at Rome, N Y, during the month In this case the physician was called in to treat a broken arm, and the defendant, against his orders, visited another physician who promptly criticized the work of the other doctor and the suit followed, another evidence of the jealousy in the medical profession and the ever-present readiness to criticize other practitioners, usually, as in this case, without foundation"

Careless remarks made by a doctor are still the basis of most malpractice suits

MEDICAL PROGRESS

Constitutional Hypotonia and Tuberculosis—F Junker calls attention to the simulation of tuberculosis by constitutional hypotonia In fully developed consumption hypotonia is a constant symptom and some authors have pointed out that it is also one of the most trustworthy of the early manifestations The author, however, dissents from such a statement for he has usually found that in the initial stage the blood pressure was normal The diagnostic injection of tuberculin is known to lower the pressure But we should not associate any given vascular tension with tuberculosis for in the fibroid type the blood pressure may be elevated At present we can only state that when the blood pressure for any reason is below normal in the consumptive this is not a good prognostic sign, while elevation is a hopeful sign Continuous study of low tension has led the author to recognize the existence of a constitutional hypotonia with its own symptom complex There is already a considerable literature on this subject and the description of the disease picture may be regarded as classic There is rapid fatigue of body and mind after exertion, need of repose, sense of oppression in the chest which at times is increased to dyspnea, sense of fulness in the stomach with regugitation and water brash, etc Other symptoms are more vague and inconstant Such patients are not infrequently pronounced to be in the early stage of tuberculosis or in a condition of latent tuberculosis with healed foci in the lungs These wrong diagnoses are sometimes backed up by the röntgen finds due in turn to malinterpretation of plates The picture of a constitutional hypotonia shades naturally into other forms secondary to thyroid insufficiency adrenal insufficiency, etc, and we may speak of a type secondary to tuberculosis, but primary hypotonia is not tuberculous for the prognosis is good and these hypotonics often live long, just as hypertonics are often short-lived—*Deutsche medizinische Wochenschrift,* September 20, 1929

Local and Conduction Anesthesia in Differential Diagnosis—Dr W K. Frankel first mentions our dependence on röntgen diagnosis as the last refinement in the recognition of abdominal disease, and the fact that the laity expect much from this resource in clearing up the nature of their painful affections This attitude may cause us to overlook other possibilities In affections of the right lower quadrant careful palpation is, of course, indispensable, but hitherto we have been indifferent to the possibility that a certain amount of surface anesthesia by eliminating sources of pain in the abdominal wall could aid us more or less in accusing the viscera We must in such a case go no deeper than the muscles, for if we anesthetize the parietal peritoneum we defeat our own aims This superficial anesthesia may readily be effected in an ordinary office examination No precise rules can be laid down for the anesthesia, for according to the case a single injection or a considerable infiltration may secure the desired abolition of superficial pain and tenderness In from three to five minutes palpation may be resumed, when it is often startling to note that the patient who previously could hardly endure handling will feel nothing even under forcible deep pressure This minor resource then may have all the force of an exploratory laparotomy without the risk of the latter The latter part of the article is devoted to conduction anesthesia used with the same aim Here there is a blocking of the rami communicantes by paravertebral injections or of any desired spinal nerve trunk Such anesthesia may be brought about by means of the ordinary local injection and infiltration The author, in cases of pressure pain at McBurney's point, has repeatedly caused this to disappear by block anesthesia Blocking of the eighth dorsal eliminates liver pain and that of the first and second lumbar nerves will eliminate the urinary organs If now the patient feels nothing on deep pressure over the appendix that organ is certainly intact—*Klinische Wochenschrift,* September 24, 1929

Fat and Lipoid Metabolism—Hans Knauer discusses this subject with especial reference to lipoid metabolism in childhood There has of late been great interest in fat metabolism, including the two groups of lipoids known as cholesterol and the phosphatides Some authors claim that we can hardly speak as yet of a metabolism of cholesterol and one suggests the substitution term of "cholesterol economy" In general, lipoid metabolism is very different in childhood and adulthood The subject is of great importance for immunobiology and the blood lipoids play a well known role in blood sedimentation, agglutination, hemolysis, etc, so that a disturbance of lipoid metabolism might conceivably modify the resistance to disease To cite an example

the condition of pregnancy even in the most normal subjects causes an increase in all the blood lipoids The fatty acids may double their normal value On the other hand there is a corresponding decrease in the blood lipoids of the fetus After delivery the maternal lipoids soon sink to normal and those of the newborn infant undergo an increase to normal This is readily understood with breast feeding, but it is evident, although in a much less degree, in the non-nursing mother and the bottle-fed baby In fact the kind of nourishment makes little difference in the blood lipoids of the infant, and this even holds good for the ailing child save in protracted or very severe illness It is almost paradoxical to note that even in rickets there is but little change in the blood lipoids, and when the child is placed on ergosterol there is no increase Experimentally severe blood losses may cause an increase, but as a rule spontaneous anemia is apt to show a diminution, thus in acute purpura there is hyperlipemia and the lowering in percentage seen in spontaneous anemia may suddenly be reversed to a hyperlipemia, probably because certain stored reserves suddenly enter the blood from the tissues Enough has been said to show the unusual interest of this apparently theoretical subject to the clinician —*Klinische Wochenschrift,* September 17, 1929

Treatment of Epilepsy with Luminal and Boropotassic Tartrate—Professor G Carriere of Lille wrote on this subject in 1922 and two of his students chose the same for their graduation theses He therefore thinks it worth while to call the attention of the Academy of Medicine of Paris to the outcome of this treatment His material is limited to pure epilepsy occurring in patients from his private and dispensary practice, who naturally are in a different class from ordinary asylum inmates He controls for the entire observation period 800 patients After one year of treatment the accesses were brought to arrest in 60 4 per cent, after two years, 70 per cent, and after three years 74 per cent The author is far from being alone in this experience, for many of his colleagues have obtained results of the same kind These are certainly superior to the old figures obtained from bromides or luminal, alone or combined There have been no untoward results, no depression However the attacks of petit mal do not benefit in equal fashion Many early failures could be traced to improper doses, to early suppression of the drugs, omission of hygiene, etc In the mild or medium case one should begin with 1 5 gm of the salt and 0 15 of luminal each day in three divided doses Severe cases need more The treatment should aim to suppress the crises and when the proper dose for this purpose has been determined it should be kept up for an indefinite period—three years or more after total cessation It may then slowly be reduced, but the patient must continue the drugs in some dose for several years more—at least 0 5 gm of the salt and 0 075 gm of luminal daily In certain cases it is necessary to add another drug to the treatment to meet some special factor in the case The same treatment is also of value in neurasthenia, psychasthenia, parkinsonism, insomnia, post-traumatic delirium, Graves's disease, etc —*Bulletin de l'Academie de Médecine,* October 1, 1929

Polyglobulia From Altitude — Dr C Monge of Lima writes of this condition under the name of erythremia It is a malady which begins to be seen at an altitude averaging 3 500 meters Locally it is known as "mountain sickness" As a rule the erythrocytes are increased to 7,000,000 or more There is also a leucocytosis The chief symptoms are dyspnea, cyanosis, vomiting, tinnitus, defective vision, epistaxis mental and bodily fatigue, etc Descent from the altitude usually relieves the acute symptoms, but sooner or later a chronic condition develops from failure to become acclimated Often, however, acclimation results and the troubles of the patient disappear The author has been able to isolate an atypical syndrome, one of attenuated mountain sickness The patient is easily winded, gets headache readily, is unable to read for any length of time, has pains especially in the legs referred to muscles or bones, and enlarged spleen A blood count may show 8,500,000 erythrocytes In this mild type there are no symptoms of cardiac weakness The patient may feel himself acclimated in the absence of any of the acute symptoms already mentioned Even patients able to thrive at the new altitude may have some polyglobulia with vague symptoms like nosebleed Knowledge of these petty symptoms is necessary for the physician to recognize adaptation, and too often supposed complete adaptation is only partial—the subject is on the road to it but has not yet arrived Even those born at the altitude, who have lived nowhere else, may show some evidence of imperfect adaptation Severe and fatal cases also occur Studies of the basal metabolism have shown that this is not altered by altitude Naturally there is a close relationship between Vaquez's disease at ordinary altitudes and mountain sickness, but its degree and kind have not yet been determined —*Archives des maladies du cœur,* Oct , 1929

Cases of Pernicious Anemia Refractory to Liver Treatment.—Professor Victor Schilling has treated 80 cases of this affection with liver substance since February 1928 Fifty patients obtained a relative recovery, the red cell count

going to 4,000,000 or better Twenty others improved for the time, but later the count dropped below 4,000,000 Of the remaining ten cases one failed to reach 4,000,000 despite prolonged treatment, 5 failed to benefit at all, and 4 are recent cases in which the result is undetermined Of the 80 cases 14 were in old patients, dating back to the early days of the liver treatment, and in whom treatment had been more or less neglected Six patients had succumbed since introduction of the treatment but autopsy did not reveal the severe anemic alterations of the old period before liver treatment In two, in fact, there was nothing in the autopsy to point to pernicious anemia Two patients in whom the treatment was hardly under way succumbed to bronchopneumonia One death was due to taboparesis with blood in good condition and one patient was affected with advanced heart and kidney disease Of the survivors only one became actually worse under liver treatment and this patient suffered from menorrhagia In many of the patients failure to progress was plainly attributable to modified technique of treatment—use of extracts in place of whole liver, etc In conclusion the author is enthusiastic over the liver treatment and he believes that even in the hopeless complicated cases life may be prolonged.—*Deutsche medizinische Wochenschrift,* Oct 11, 1929

Treatment of Sterility by Inflation of the Tube.—Professor A Mayer refers to the increasing interest in this subject and gives the results in 406 cases in which Sellheim's technique was used In order to prevent untoward results all possible precautions were taken and certain patients were automatically excluded, as victims or suspects of recent infection To avoid air embolism a pressure of 150 mm mercury was not exceeded In but one case was there a subsequent rise of temperature with signs of pelvic peritonitis Entrance of air into the tube was controlled by auscultation Of the sterile women 66 per cent suffered from primary sterility There were 271 women in this group and of this number 57 conceived after inflation (21 per cent), 48 children were born and 9 women aborted The number of women with secondary sterility was 135 or 34 per cent and 41 or 30 per cent conceived after inflation, while 35 children were born and 6 women aborted Individual statistics are often of much interest Thus of 103 women with hypoplastic uterus 27 per cent conceived, a higher figure than the average Some question as to the role of abrasion of the uterus which precedes inflation comes up, for it is contended that this may favor conception Complete impermeability of the tube was found probable in 17 per cent with primary sterility and 14 per cent with secondary sterility, and in not a few other cases there was probably an endocrine disturbance which inflation could not remedy.—*Munchener medizinische Wochenschrift,* September 27, 1929

Acetonemic Vomiting—E Koehn refers to an infection which developed among small children shortly after Christmas festivities, involving the respiratory and gastroenteric systems, at the onset of which there developed cases of acetonemic vomiting Histories of four of the most severe cases are given and a total of nine is mentioned in the author's practice Vomiting was severe and became incoercible and the children were dehydrated Every attempt to give food and medicine was followed by vomiting The children were very ill and tuberculous meningitis was thought of The odor of acetone was marked in some cases, although of nine tested by the Legal method only four of the urines gave a strongly positive test Diagnosis of the basic affection was difficult The children were mostly neuropathic, although only one was notably so, and in some cases there was no suggestion of nervousness An influenza infection could be thought of, for this sometimes causes acetonemic vomiting Only one child was known to have abused diet But no theory appears to apply to all of the cases Despite the menacing character these patients usually recover with abrupt cessation of the symptoms Feeding with carbohydrates is a specific in these patients if they can be made to ingest them The author began with ice cold buttermilk, to which was added 10 per cent of sugar This was fed every quarter hour by the teaspoonful Gelatin water, 6 per cent with sugar addition, may be substituted To the latter milk may be added in increasing amounts If the stomach cannot be made to retain anything glucose enemata and even intravenous infusions must be given.—*Deutsche medizinische Wochenschrift,* October 4, 1929

A Case of Schilder's Disease (Encephalitis Periaxialis Diffusa)—C T Champion de Crespigny and H H Woollard find that so far only 20 to 30 cases of this rare clinical entity have been recorded The case which they report was that of a previously healthy child of 8 years who suffered from a progressive illness lasting between five and six months Failure of hearing and spastic paraplegia were the first symptoms There was rapidly increasing speech defect leading to complete dumbness Sight was more gradually lost and spastic paralysis increased in the lower limbs and extended to the upper Finally death occurred rather suddenly a few hours after the onset of acute symptoms of cerebral inflammatory type Post-mortem examination showed no abnormality except in the brain H H Woollard who made the patho-

logical examination, states that macroscopically the brain has given a very similar picture in some 17 of the 23 or more examples of this disease that have now been collected The brain in the present case presented no external evidence of disease When it was sectioned, however, there was disclosed an alteration in the white matter of both hemispheres, including the posterior part of the corpus callosum The areas of white matter involved were those of the occipital and temporal regions The gray matter immediately adjacent to the affected white matter appeared normal, and the passage from the affected white matter to normal areas was abrupt Microscopically, the process of demyelinization is the characteristic feature of the disease, which is not truly periaxial, for it spreads rapidly beyond the medullary sheath and affects the axis cylinders which soon disappear *Inflammatory reactions of the* nature of perivascular lymphocytic accumulations were also disclosed, similar to those which have been reported for other cases of Schilder's disease examined microscopically Since the essential features of these cases are so constant and uniform, the authors conclude that the condition is a disease entity with its own special etiology —*The Lancet*, October 26, 1929, ccxvii, 5539

Reciprocal Agglutination of the Maternal and Fetal Red Cells — E Bansillon writes especially of the clinical and therapeutic significance of this agglutination In the earliest years of the century it was discovered that in certain cases of normal individuals, serum of one would agglutinate the red blood cells of the other The author has studied this interagglutination since 1925, with special reference to maternal and fetal blood He finds that in 15 per cent of all infants tested the serum will agglutinate the red cells of the mother The first practical lesson to be learned is naturally that one should not transfuse maternal blood into the fetus without a preliminary test The agglutination test ought to be made before recourse to transfusion, *although this is more of less difficult for several* reasons The author, however, has followed it up for a sufficient length of time to justify him in claiming that it is practicable in the clinic In regard to pathological explanations and significance of this phenomenon the author cannot as yet set up any rules, but the evidence suggests that in such discrepant cases pregnancy has not been well tolerated He even intimates that fetuses which will present this discordant quality may be a factor in the production of pregnancy toxicosis In such cases there has often been a history of vomiting of pregnancy The author has, however, been unable to accept the theory of MacQuarrie that this incompatibility of blood is *responsible for* cases of puerperal eclampsia In regard to the malady of the infant which might favor agglutination of the maternal blood, the author has noted cases in which benign catarrhal icterus was present He also suggests that the agglutinins of the nursling may not be natural to the infantile blood but may proceed from the maternal colostrum or milk The presence of icterus of any kind in the fetus may of itself constitute a contraindication to transfusion with the blood of a normal donor — *Journal de Médecine de Lyon*, October 5, 1929

Supplying the Breast-Fed Baby with Vitamin B —John Howell West states that experimental investigations have shown that vitamins are essential to the lactating mother if she is to supply suitable nourishment to her *infant At the present time* vitamins A and D are usually adequately supplied by cod-liver oil, and ultraviolet radiation has become general Irradiated ergosterol under proper supervision also supplies vitamin D in large quantities Vitamin C is provided by adding fruit juice to the infant's dietary Vitamin B, the growth-promoting factor, is, however, frequently lacking, and human milk is often deficient in this vitamin In babies subsisting on a diet deficient in vitamin B, Hoobler and Dennett have found the following symptoms Anorexia, indifferent gain in weight, general spasticity, restlessness, and fretfulness with pallor Vitamin B may be supplied to the baby by furnishing the mother with a diet adequate in vitamin B, or by complementing human milk in the usual way with the addition of vitamin B containing substances to the formula West found that of 48 mothers *who* took a diet rich in vitamin B only three were unable to nurse their infants entirely, and in the case of babies receiving complementary feeding, the mother was gradually able to stop it and rely upon the breast-feeding alone West recommends for the mothers the following diet (1) One raw fruit (orange, grapefruit, tomato), (2) two cooked green vegetables, (3) one raw green vegetable such as lettuce, endive, etc , (4) one quart of milk, once a week, calf's liver, kidneys, or sweetbreads, (5) one tablespoonful of wheat-germ sugar The remainder of the diet is made up of ordinary palatable foods When complementary feedings are used, a formula is given to which is added wheat-germ sugar or dried brewer's yeast In a 20-ounce formula one to one and a half teaspoonfuls of dried pasteurized yeast is added As many breast failures occur during the first few weeks after birth it is suggested that the full vitamin-containing diet be started as soon as possible during the puerperium or, better, during pregnancy — *Archives of Pediatrics*, October, 1929, xlvi, 10

LEGAL

By Lloyd Paul Stryker Esq
Counsel Medical Society of the State of New York.

GRATITUDE

We venture to say that the highest reward of the doctor is the knowledge that he has served well and truly the afflicted ones who have come to him for treatment and advice Serving often for nothing, or for wholly inadequate compensation, the physician has a right to expect at least gratitude from his patients But, many times in exchange for devotion, charity and self-sacrifice he meets with unjust criticism and gross ingratitude

Your counsel feels well qualified to write on this subject, since daily in court and out he is defending the profession against claims and suits many of which contain elements of base ingratitude on the part of the patient To your counsel one of the most distressing features of this situation is the effect on the physician s philosophy of life As one physician recently said, referring to a most unjust malpractice suit which had been brought against him "This experience is enough to sour the milk of human kindness From now on I am hard boiled ' Of course, the doctor did not really mean that but one can understand and sympathize with his perfectly natural and human reaction to the ingratitude of his patient

The medical profession does not receive the gratitude to which they are justly entitled for their untiring efforts in the interests of suffering humanity Rarely does the courage, devotion and self-sacrifice of the doctor receive even a passing comment of praise The world forgets that the doctor must meet the material obligations of life in exactly the same manner as those outside the profession It forgets that in common with all the rest of mankind the doctor needs sleep, rest, recreation, encouragement and loyalty

But the doctor carries on Neither illness nor fatigue, discouragement or financial strain can swerve him from his loyalty to the ideals of his calling Your counsel is proud to be the champion and advocate of the members of so noble a profession

---

CLAIMED NEGLIGENCE IN OPERATION FOR MIDDLE TURBINATE

In this case the plaintiff sued two physicians alleging that he engaged physician A to perform an operation on his nose, and that this physician did perform the operation and thereafter placed and stuffed two packings or gauzy substances in the plaintiff's nose, and thereafter physician B as the agent, servant and employee of physician A undertook to treat the plaintiff's nose and attend and care for him, and that physician B as the agent of physician A carelessly and negligently governed himself in the care and treatment of the plaintiff in that he did not remove the packings which had been placed in the plaintiff's nose, as a result of which the plaintiff claims his right ear was caused to become infected and diseased, causing an acute mastoiditis necessitating an operation to be performed on the plaintiff's ear, as a result of which he claimed erysipelas developed Damages were prayed for in the sum of $150,000

Some five years before the operation, which formed the basis of this action, the plaintiff came to physician A giving a history of a clogging in the nose and also of a susceptibility to colds in the head The doctor examined the man and made a diagnosis of an enlarged middle turbinate, for which the doctor recommended an operation The man promised to return, but he never did so until some five years later, at which time an examination disclosed that he still suffered from an enlarged turbinate and also from a deflected septum The doctor advised operative procedure and the plaintiff consented The doctor then under a local anaesthetic removed the internal third of the turbinate, packed the nostril with gauze strips and directed the patient to return the next day to have it dressed Physician A was taken ill the day of the operation and he obtained the services of physician B to look after his practice while he was ill Physician B treated the plaintiff on several occasions and removed all the packing and also applied medication to the plaintiff's nose Physician A returned to his practice in about a week's time

and examined the plaintiff on several occasions thereafter His nose was in good condition and at no time was any packing found in the plaintiff's nose On one occasion he complained of pain in his ear, claiming that this was caused by packing being left in his nose, but the doctor explained to him that no packing had been left in the nose On examination of his ear the doctor found that it was congested, and on opening the abscess found a sac of pus which he cleaned out The patient returned every day for about a week, at which time physician A dressed the abscess in his ear He was also directed to have an x-ray picture taken of the mastoid and return to physician A, but he never did return, nor did either of the defendants ever see him again until action was commenced

The case came on for trial and the issues raised by the pleadings were submitted to a jury, who returned a verdict in favor of the doctors

CLAIMED NEGLIGENCE IN THE TREATMENT OF A FRACTURE OF THE FEMUR

In this case the complaint charged that the plaintiff went to a hospital for treatment for injuries to her left hip, the same being broken at the neck of the femur, and that the defendant as a physician and surgeon there undertook to operate and endeavor to cure the said broken hip, and for that purpose applied a plaster cast to the injured part, that almost immediately after the cast was applied the plaintiff suffered great pain in the back of the foot in the region of the heel at a point where the same was covered by the cast that the pain continued for about a period of nineteen days and when the cast was cut down there was found to be present a perforated ulcer It was charged that the defendant's negligence caused the plaintiff to become sick, sore and disabled, that she suffered from injury and mental anguish, and it was also charged that the plaintiff has been permanently damaged and perhaps will be required to have her foot amputated Damages were prayed for in the sum of $50,000

The plaintiff was a woman about 55 years of age She had fallen in her home and a physician was called in who put on a temporary splint The following day she was removed to a hospital While at the hospital she requested the defendant to be called in to treat her The defendant physician on being called in immediately had an x-ray made of her hip, and on examination of the plates he found a complete fracture of the neck of the femur, the bone being broken completely across He found her in splints and a day or two later removed the splints and put on a complete cast extending from the chest down to the toe In getting the bone into proper position, it was necessary to set the leg in a position of abduction, extension and internal rotation The doctor explained to this woman that the cast was not put on for the purpose of making the patient comfortable, but it was put on because it was recognized as the best method of treating a fracture of this type, in order to insure, if possible, the good result which was obtained in this case After this the doctor left the cast on and saw the patient daily From the first day the patient complained of pain in her hip and thigh and as this was the necessary result of the position of the leg, the doctor did not disturb the cast About the fourth day the patient complained of pain in her heel and the doctor pulled out some of the wadding with which he had padded it to give her relief and this seemed to relieve the pain in the heel The doctor continued to see the patient daily and she still complained of pain in the hip and thigh, but no pain in the heel On the nineteenth day when the patient again complained of pain in the heel, the doctor cut a hole in the cast about three by four inches and found a necrotic eschar condition The skin for an area of about two by three inches had become black and hard This seemed to relieve the pain She was seen daily by the doctor for the next two weeks when he removed the cast An x-ray was taken which showed that there was a good bony union and practically perfect position The doctor advised the patient to remain in the hospital where they had facilities for baking, etc , which would have hastened the return of the function of the leg and the healing of the sore on her heel She, however, refused to remain in the hospital and left within a day or two after the cast was taken off against the doctor's instructions, and returned to her home some distance from the hospital

After the action had been begun the same was discontinued and the case was terminated in favor of the defendant

LONDON LETTER

London, December 1, 1929

Occupation After Retirement The problem of finding a suitable occupation after retirement has been most happily solved by one of our most eminent surgeons Sir James Berry, whose work on the thyroid gland has made him world famous has settled down in his country home in Buckinghamshire and is devoting himself to an investigation into manorial rights, a subject which allows him to combine his great antiquarian knowledge with his genealogical and geological studies But he can be tempted to come to town, and last week I saw him welcome a party of Jugoslav doctors who were visiting London His speech, delivered with great fluency in the Serbian language, might well have surprised his hearers, were they not aware of all he did for Serbia during the great war While still a young man he spent many holidays cycling in the "Near East," and when the war came he took a Hospital Unit to Serbia and had many adventures, including being taken prisoner by the Austrians It seems so short a time since he was trying, so patiently to instil into my youthful mind the elements of surgery—Well! well! Did not Swift say that no wise man ever wished to be younger"

Winter Session Medical Schools The beginning of the Winter Session at the Medical Schools is signalized by the delivery of many introductory addresses, and this year a new note was struck by Sir Farquhar Buzzard, Regius Professor of Medicine at Oxford a chair which Osler once occupied Speaking at Birmingham he deplored the fact that the medical profession 'live in an atmosphere which may be described as unsympathetic and suspicious, if not actually antagonistic," and he tried to find a reason for it He pointed out that the education of a medical man is essentially different from that of the general public, in that the doctor is trained in precise methods of investigation, he learns to distinguish facts from theories, and "generally has developed a critical faculty of which the lay mind is, perhaps mercifully, completely innocent" When the patient and the doctor come together, the taking of a history, wrapt up as it generally is in a mass of unimportant or even untrue observations, is so difficult and takes so much time, that the doctor, feeling sure that he will not gain much, however searching his examination, turns a deaf ear to stories which at any rate mean much to the patient And as experience tells him that his explanations have often been misinterpreted and his opinions wrongly reported, he tells the patient as little as possible, with the result that the patient feels that he has a double grievance, in that the doctor will neither listen to what he has to say nor tell him what is the matter with him But perhaps Sir Farquhar's chief criticism was that the doctor, pressed by his patient for a cure, takes up with enthusiasm each new panacea which presents itself and extols out of his ignorance the virtues of vaccines, liquid paraffin, radium, brown bread, or ultra-violet rays My belief is that there has always been, in the mind of the layman, however well educated, an instinctive fear of the scientist It was fostered in the dawn of civilization by the magician and the witch doctor, and however far we have progressed since those days, there is much of the savage in us all, and a belief in the evil eye is not far below the surface Our duty is plain, to keep our balance in a world which seems to revolve too rapidly, and to earn the respect of our patients by the sanity of our judgment

Spreading of Diseases From time to time letters appear in the public press and in the medical journals calling attention to the risk to health and the danger of spreading epidemic diseases among those who use the public swimming baths The Ministry of Health has just issued a report after a thorough investigation, and while it is agreed that there is no evidence to support the theory that epidemic disease is spread through this agency, there is proof that the water in many public baths is deplorably dirty and may be a source of danger to health It has long been recognized that many cases of otorrhoea can be traced to bathing, and the wearing of inadequately cleaned bathing suits has caused ringworm The report contains some practical suggestions to ensure the cleanliness of the water In London where there are about 100 public baths 45 are fitted with adequate filtration plants and progress is being made in the provinces It is not a simple matter, and it is not easy to decide which of the 8 methods in use is the best Sterilization is not enough but in addition to a correct chlorination, filtration and aeration are essential The report will do good if, while drawing attention to the need and giving practical advice as to maintaining the cleanliness of the water, it allays the fear of the risk of spreading epidemic diseases

H W Carson, F A C S

NEWS NOTES

COUNTY HEALTH DEPARTMENTS FOR CORTLAND AND TOMPKINS COUNTIES

The counties of Cortland and Tompkins have been considering the establishment of county departments of health for over two years The campaign in each county originated with the County Medical Society, but the physicians in each county permitted the leadership to pass to other health agencies In the meantime the physicians of Suffolk County succeeded in securing a County Department of Health after a two-year campaign managed entirely by the Suffolk County Medical Society, but with every civic organization in the county in hearty sympathy with the movement The experience of Suffolk County encouraged the physicians of the other two counties to take a renewed interest in the proposed health department of their own counties

Cortland County

When the District Branch of the Medical Society of the State of New York met in Cortland on September 27, 1929, Dr W H Ross of Brentwood, President of the Suffolk County Department of Health, and President-elect of the Medical Society of the State of New York, and a member of its Committee on Public Relations, discussed the proposed Cortland County Health Department informally with officers of the Cortland County Medical Society and Commitee of the Board of Supervisors He found that the Board of Supervisors would probably be favorable toward a County Health Department if one could be organized on lines simpler and more practical than those advocated by the lay health organizations working in Cortland County

The leaders of the Cortland County Medical Society proposed that Dr Ross representing both the Suffolk County Board of Health and the Committee on Public Relations of the Medical Society of the State of New York, should come to Cortland and tell the physicians about the plan of organization of the Suffolk County Board of Health and the manner of its promotion The Committee of the Board of Supervisors also invited Dr Ross to address the Board on the advantages of a County Board of Health considered from business and economical points of view It was agreed that Dr Ross should meet with the physicians in an evening meeting and should address the Board of Supervisors on the following morning

The details of the two meetings were arranged by Dr Frederick W Sears, of Syracuse, District State Health Officer, who was on extremely friendly terms with the physicians, and had been one of the leaders in promoting the county department The Comitia Minora of the Medical Society and other physicians accordingly met on the evening of November 19 as the dinner guests of Dr Albert C Knapp of Cortland There were also present the County Judge, representatives of the Board of Supervisors, and Dr Frank Overton, of Suffolk County, Editor of the New York State Journal of Medicine Dr Ross talked simply and informally, and told the story of the Suffolk County Department of Health and the manner of its organization, and advised that the physicians of Cortland County advocate the establishment of a similar one in their own county

The sentiment of those present was entirely favorable toward a county department of health to cost about $25,000 annually, one-half to be paid by the State of New York

On the following morning, Dr Ross addressed the Board of Supervisors of Cortland County briefly in regard to the proposed county health unit Representatives from the Cortland County Medical Society also appeared before the Board and requested the Board to establish such a unit

Later in the day the Board of Suervisors voted to establish a health department for Cortland County

Tompkins County

Conditions in Tompkins County were very similar to those in Cortland In 1926 the Tompkins County Medical Society took up the question of establishing a county health department, but did not reach a definite conclusion Later the Board of Supervisors of the County appointed a committee on public health to have the management of public health nurses which were employed by the county This committee was active and took the leadership in a campaign to establish a county health department, but its members were uncertain as to the details of the proposed county health unit, while the doctors

held themselves aloof This was the situation when the District Branch met in the Fall

When Dr Ross made arrangements to meet the Cortland County Medical Society on November 19 it was also arranged that he should go to Ithaca and meet the physicians of Tompkins County He and Dr Overton, therefore met the Public Health Committee of Tompkins County at a noon luncheon in Ithaca at which there were present several representatives of the local Public Health Organization, a member of the Board of Supervisors, and Dr H E Merriam Chairman of the Public Health Committee of the Tompkins County Medical Society The local situation was discussed in detail, and Dr Ross outlined the organization of the Suffolk County Health unit He also emphasized the point that ordinary public health work is done mostly by the doctors who do the detail work of carrying it out, for in the last analyses it is the individual doctor who gives toxin-antitoxin to each individual case, and treats the defects of school children, and gives all other forms of preventive treatment A county health department cannot be organized or conducted without the hearty cooperation of the physicians Dr Ross said that the next step that must be taken in Tompkins County is to hold a meeting of the Tompkins County Medical Society and explain the relation of the proposed health unit to the doctors themselves

It had been planned that the General Committee on Public Health should hold a joint meeting with other health organizations in the evening to be addressed by Dr Ross, but Dr Ross insisted that as many doctors as possible should be invited The members of the Committee therefore called up as many doctors as they could reach and twenty-two physicians came to the evening meeting in order to hear Dr Ross, while the number of lay health workers brought the number present to over one hunderd

The evening meeting began with a supper in Freeville in the hotel conducted by the George Junior Republic At the after-dinner speaking, Dr Ross directed his remarks principally to the physicians, and explained how the Suffolk County Health unit had been promoted by the Suffolk County Medical Society, and how the Medical Society was now acting as adviser to the Board of Health Suffolk County had promoted and constituted the Health Department as a purely medical measure, and he advised the Tompkins County people to act under the leadership of the physicians

At the conclusion of his address, the comments and questions by those present, both physicians and laymen indicated that the address of Dr Ross, had a very great educational value, and that all present were favorably inclined toward a health unit such as Suffolk County has established It was tentatively agreed that the medical leaders should call a meeting of the County Medical Society in the near future at which the Society should determine the kind of health department which Tompkins County needs and should advise the Board of Supervisors of the attitude of the physicians, with the prospect of having their suggestions adopted

The meetings in Cortland and Tompkins counties demonstrated in a most striking way the influence which physicians may have in promoting preventive medicine in their own communities The meetings also demonstrated the very great value of the Public Relations Committee of the Medical Society of the State of New York in showing local leaders how they may best make their influence felt

---

PUBLIC RELATIONS COMMITTEE

The regular monthly meeting of the Committee on Public Relations was held in the morning of Monday, November 18 1929, with Dr James E Sadlier, Chairman, presiding, and all the members present

Dr Sadlier announced that the Board of Supervisors of Lewis County had made an appropriation of $80,000 for a general hospital for the County on the condition that the State should duplicate that amount, that Greene County was progressing in its plans for a general hospital with the expectation of State aid and that Wyoming County was continuing its plans for securing State aid for acquiring the general hospital in Warsaw

Dr Sadlier also announced that the people of Tioga County are now erecting a general hospital

The Chairman also presented a study made by Dr J S Lawrence Executive Officer on the general hospitals of Pennsylvania which are conducted by State aid or by the State itself These hospitals originated in the need for facilities for giving medical service to isolated industrial groups, such as new mining camps, but as the communities grew, the hospitals continued to be the only medical centers and the State gradually extended its aid until hospitals were State supported in communities which were able to provide their own medical facilities

The State of Pennsylvania also paid ordinary general hospitals for the care of poor people on two bases 1, the general deficit of the hospital, and 2, the days of care given to poor cases Abuses have crept into the system, and there is much criticism of the method of giving State aid to general hospitals It was felt that the Pennsylvania method could not be adapted to New York State

The greater part of the time of the meeting of the Public Relations Committee was devoted to the consideration of the principles and requirements on which State aid would be granted Dr Sadlier reported that the aid would be given under the provisions of the Public Health Law, Article II-B, Section 19, 19-a and 19-b

Section 19 reads

"*State Aid to Counties Engaging in Public Health Work* Whenever the board of supervisors of any county shall appropriate and expend moneys for the construction, establishment or maintenance by such county of a county, community, or other public hospital, clinic, dispensary or similar institution, or for the purpose of defraying the expenses of such county in any public enterprise or activity for the improvement of the public health, or any public health work undertaken by such county, within limits to be prescribed by the state commissioner of health, such county shall receive state aid in the manner and subject to the conditions prescribed in this article, except that a grant of state aid covering projects, enterprises or activities established or carried on or to be established or carried on in a city having a population of fifty thousand or more shall not be made to a county under this article The legislature from time to time shall make appropriations for the purpose of rendering such state aid The state commissioner of health is hereby empowered to prescribe limitations upon the aid to be granted, under applications now pending or hereafter named (Am'd by L 1924, ch 278, and L 1927, ch 195")

Section 19-a reads

"*Approval of State Commissioner of Health* It shall be the duty of the state commissioner of health to *formulate standards* of construction, equipment, service, administration and work which must be complied with by such counties in order to be entitled to state aid, and no state aid shall be given to any county unless the state commissioner of health after inspection and examination by him or his representative, shall make his certificate that such construction, equipment, service, administration or work is necessary to the public health and conforms to the standards so established therefor, and to the limits prescribed by him as required by section nineteen of this article (Am'd by L 1924, ch 278")

Section 19-b sets forth the manner by which the Board of Supervisors shall make application for state aid

Dr Sadlier stated that the principle of State aid to general county hospitals seemed acceptable to the State Commissioner of Health and the State Budget Committee, and that the Committee on Public Relations is now confronted with the problem of formulating rules and regulations for the management of the hospitals that receive State aid While the Commissioner of Health would make the rules, yet the subject is new and there are no precedents which may be followed It is the duty of the committee to express the point of view of the practising physicians who will use the hospital

At the very outset the question arises—what physicians may treat cases in a hospital receiving State aid? Shall the staff be open to all the physicians of the county or shall there be an appointed staff consisting of only a few of the more skilled physicians?

In favor of an open hospital is the American principle of equal rights and privileges for all If any physician is excluded from treating his own cases in a hospital, there would be grounds for complaints of favoritism, and for discords among the doctors

In favor of the closed hospital with a limited number of physicians is the efficiency which is possible when a chosen few specialists form the staff

However, the members of the committee were unanimous in the opinion that three standards should be required from every doctor who treats a case in a hospital receiving State aid

1 Every physician shall write a complete history of every case, which shall be filed in the history room and be subject to criticism and review by the other members of the staff at the staff meetings

2 Every physician shall call a consultant as soon as the ordinary indications for a consultation arise

3 Every physician shall be subject to the rules and ethics of his profession and of gentlemen

There are few precedents for the interpretation of these principles, but the committee felt that in each county they might be left to the County Medical Society and its censors

Dr W H Ross, secretary of the committee, announced that he had engagements to meet the physicians of Cortland and Tompkins counties, and discuss with them the establishment of a county health department in each county (See page 1520 for a report of these conferences)

The committee adjourned at 12 30 in order

to attend a luncheon meeting of the Albany County Health Week After the luncheon the members of the committee held an informal conference with Dr Mattia Nicoll Jr, Commissioner of Health, on the standards and methods of giving state aid to hospitals

The needs and dangers of state aid to county hospitals were considered at length from two viewpoints First, State aid might diminish community interest, and second, State aid would provide facilities for medical service to people who would otherwise not have it If community interest is diminished, an undesirable situation might develop If the individual interest of people of wealth is diminished, the chance of endowment is lessened Many things should be thought out, first, the influence of changing conditions due to better transportation Some counties may be so placed that they do not need a hospital because they are already near enough to hospitals and it might not be practicable to undertake to have an added hospital,— and would such aid be beneficial?

It was the opinion of the committee that a most thorough investigation of the needs of each county should be made before any State grant should be given in every county that could apply under the present law If the State is to aid any one county because it applies for State aid, why should it not be offered to other counties perhaps even more in need though they have not yet requested it? In other words, should State aid be granted because of application, or should State aid be given because the State has found out that State aid is necessary for the health of the citizens and the county is not financially able to provide the funds?

The Public Relations Committee had a further conference with Commissioner Nicoll regarding the relation of the local profession to hospitals receiving State aid The committee stated its opinion that they should be open hospitals, each with an organized staff and having a medical board to control the quality of the work done The Commissioner of Health expressed gratification in knowing that the Committee on Public Health would always be ready to advise with him on matters that concerned the general practice of medicine in its various contacts with the State Department of Health

W H Ross, *Secretary*

COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

Reports by the Chairman, Dr Thomas P Farmer to the Executive Committee.

The Chairman of the Committee on Public Health and Medical Education herewith submits the following report for the months of July and August, 1929

Notwithstanding the fact that the months covered by this report are largely vacation periods, still the activities of this committee have gone on just the same

A course of four lectures on Tuberculosis was completed on July seventeenth in Rockland County Reports indicated that all lectures were very favorably received The attendance despite the warm weather was most satisfactory This course was sponsored jointly by the State Department of Health and the State Society One lecturer, Doctor F M McPhedron, was brought from without the state by special request of the Rockland County Medical Society Doctor McPhedron is connected with the Henry Phipps Institute in Philadelphia, Pennsylvania, and gave the talk on Tuberculosis in Children This course demonstrates that the State Department of Health and the State Society can and should cooperate in giving many of the post-graduate courses especially those of a distinctive public health nature

Much time has been spent on organization of the fall courses It is expected that the following courses will be definitely given this fall Traumatic Surgery, Tioga, Internal Medicine, Washington, Internal Medicine, Sullivan, General Medical Course, Steuben, Surgery, Wayne, Surgery, Ontario, Heart Disease, Monroe, Heart Disease, Genesee,

We expect to have Livingston County join with Monroe, and Wyoming and Orleans to join with Genesee County in its course We are also expecting to have Warren County join with Washington, and Seneca join with Ontario It is most probable that courses will be given also in Schoharie and Otsego Counties, and possibly Clinton and Columbia Counties Arrangements are completed for most of these fall courses as far as they can be at this time of the year with so many of the lecturers just returning from their vacations

A letter was sent to the Secretary of each County Medical Society early in July asking for information regarding the public health activities of each county society and also their plans for graduate education Replies were received from forty-five county societies, exactly 75% of the entire state. Many of these replies were returned immediately, and while this is a very credible showing, it is to be re-

gretted that 25% of the county societies should fail to give one of the State Societies committees a small amount of information which was asked for The blanks which have been returned are a help to our committee in planning our year's work in graduate education, as we are able to get an early impression of the desires of the various county societies in this matter Of the forty-five county societies replying, twenty-four reported that their county society was not actively engaged in any specific public health work The Chairman of this committee will elaborate more on the analysis of these replies at a later time

The Chairman attended the meeting of the Keuka Lake Medical Society on July eleventh and at that time held conferences with representatives from Monroe, Steuben, and Wayne Counties regarding their courses for this fall

---

The Chairman of the Committee on Public Health and Medical Education submits the following report for the month of September 1929

The Chairman's office during this month has been very busy completing courses in the following counties with the subject of the course and the date upon which the course begins listed after

Wayne	Surgery	September 18
Ontario	Surgery	October 2
Washington	Internal Medicine	October 3
Tioga	Traumatic Surgery	October 8
Steuben	Internal Medicine	October 10
Monroe	Heart Disease	October 21
Genesee	Heart Disease	October 21
Sullivan	Internal Medicine	October 30

There will be 45 lectures given in these 8 courses, all of which have been definitely arranged for at the present time except one of the lectures to be given in December in Sullivan County Six adjoining counties will join with different counties in attending these lectures In four counties arrangements have been made whereby the lecturer will give two lectures on the same day, each one in different counties The list of teachers is an unusually good one comprising medical teachers from several colleges in New York City, as well as Rochester University and Syracuse University The committee has been careful in planning its programme for the fall in order to bring competent teachers to the county societies with the least expenditure

During the month of September the Chairman attended the conference of Secretaries of County Medical Societies called by the State Secretary in Albany on September 10th, at which time the subject of post-graduate courses was generally discussed He attended the meeting of the Executive Committee on September 12th, and on September 20th he attended the meeting of the Special Committee on Periodic Health Examinations in Saratoga He also attended meetings of the 6th and 7th district branches held respectively in Clifton Springs, September 26th and Cortland, September 27th At the last mentioned meetings as well as at the conference of the county secretaries the Chairman had conferences with representatives of several county societies regarding courses to be given this fall, as well as courses to be given during the spring This committee is cooperating actively with the Special Committee on Periodic Health Examinations and the Special Committee on Physiotherapy A list of the Chairmen of the Public Health Committees of County Medical Societies is to be sent to each of these committees The Chairman has also had conferences with two medical teachers regarding new courses for presentation by the Committee

---

I herewith submit my report as Chairman of the Committee on Public Health and Medical Education for the month of October, 1929

Our principal activities during this month have been concerned with the routine work of courses given in the county societies as mentioned in my last report All of the fall courses have been started The Monroe and Genesee County courses were given during the week of October twenty-first and were most successful from every standpoint Monroe County, with a membership of 436, showed an average attendance of 168 The largest attendance of any session was 205, and the smallest, 138 Genesee County with a membership of 28 had an average attendance of 33, the largest attendance being 43 and the smallest 22 It must be remembered that Wyoming and Orleans joined with Genesee County, and that Livingston joined with Monroe

The Chairman attended the meeting of the Monroe County Society on October fifteenth, and the Fifth District Branch meeting on October seventeenth At both of these meetings he spoke of the work of the Committee

The Chairman has had conference with Doctor Bogardus of the Division of Tuberculosis of the State Department of Health at the request of Doctor Plunkett, Director of that Division This conference had to do with the subject of interesting county medical societies in a study of the mortality rates for tuberculosis in their counties and for the need of further efforts to control tuberculosis An attempt to do this will be very shortly started through the combined efforts of the Division of Tuberculosis of the State Department of Health and this Commitee

THOMAS P FARMER, M D, *Chairman*

PUBLIC HEALTH WEEK OF ALBANY COUNTY

The County of Albany, New York, held a Public Health Week from Monday, November 18, until Friday, November 22, 1929, under the auspices of all the health agencies in the County, with an Executive Committee, of which Dr Matthias Nicoll Jr State Commissioner of Health, was Chairman There were seven official health agencies listed as cooperating, while the non-official agencies numbered forty-six, listed alphabetically from the Albany Chamber of Commerce to the Zonta Club

The major meetings were held on the plan of a luncheon meeting at about noon, at one of the hotels, and an evening meeting at 8 o'clock in Chancellors Hall, the assembly room of the State Education Building The principal features of the program were as follows

November 18, luncheon-meeting, sponsored by the League of Women Voters Dr Edward L Keyes, President of the American Social Hygiene Association, was the speaker

The evening meeting was addressed by Dr Hugh Cumming, Surgeon General of the United States Public Health Service, who spoke on the relation of the service to the state and the local community

November 19, noon meeting, sponsored by the Council of Women's Clubs and the Albany County Medical Society Speaker, Dr W H Ross, Brentwood, President-elect of the Medical Society of the State of New York and President of the Suffolk County Department of Health, on the subject, "Better County Health"

The evening meeting was on the subject, "Personal Application of Mental Hygiene," and the speaker was Dr Bernard Glueck Medical Director of Stony Lodge

The Wednesday-noon meeting was sponsored by the Albany Guild for Public Health Nursing The subject of Public Health Nursing and the Community was presented by Mrs Anne Hansen, President of the National Organization for Public Health Nursing

The evening address was on the subject of Cancer, and the speakers were Dr Burton Simpson, Director of the State Institute for the Study of Malignant Diseases, and Dr Joseph Colt Bloodgood, Clinical Professor of Surgery, Johns Hopkins School of Medicine

On Thursday noon the sponsor was the Albany County Health Committee Miss Grace Abbott, Chief of Children's Bureau, U S Department of Labor, spoke on "Child Health as a County Problem"

No meeting was held Thursday evening

The speakers on the program of the midday meeting on Friday included Mr Homer Folks, of the State Charities Aid Association, Dr James N VanderVeer, President of the Medical Society of the State of New York, and Dr C Ward Crampton, Chairman of the Committee on Periodic Health Examinations of the State Medical Society

The principal speakers at the evening meeting were Governor Franklin D Roosevelt, and Dr George E Vincent, President of the Rockefeller Foundation

A health exhibit was shown every evening in the corridors of Chancellor's Hall which was prepared by the State Department of Health, the State Charities Aid Association and other health agencies

One of the most important features of the Health Week was the opportunity for public health workers to get acquainted with one another in social groups at the luncheons and between meetings

It was a coincidence that the Superintendents of all the State Hospitals were also present in Albany in order to present the financial needs of their institutions to the State Budget Committee for transmission to the next legislature

---

PRIZE ESSAYS

The Medical Society of the State of New York again takes pleasure in announcing that the Merritt H Cash and Lucien Howe prizes will be open for competition at the next annual meeting which will be held in Rochester, June 2nd, 1930

The Lucien Howe prize, consisting of a medal and $50 00 in cash, will be awarded for the best original contribution to the knowledge of surgery, preferably ophthalmology, and is not limited to the members of the State Society, any physician may compete for it

The Merritt H Cash prize of $100 00 will be awarded for the best original essay on medical or surgical subjects and is only open to members of the Medical Society of the State of New York

The essay shall be typwritten or printed, and the only means of identification of the author shall be a motto or other device It shall be accompanied by a sealed envelope, having on the outside the same motto or device, and containing the name and address of the writer

Essays must be presented at least one month in advance of the annual meeting, and should be sent to the chairman of the committee, Dr Thomas H Curtin, 391 East 149th Street, New York City, not later than May 1, 1930

THE DAILY PRESS

MEDICAL ECONOMICS

Wherever two or three doctors are gathered together, the conversation turns to the recent slump in the stock market. The surprising revelation is the small proportion of physicians who have lost their money Doctors are no longer the poor business men that they were formerly supposed to be, but with the general prosperity of the country they too have prospered

Business prosperity has also resulted in better health Some writers have been so unkind as to suggest that the reduction in the amount of tuberculosis has been due to financial prosperity quite as much as to the doctors Certainly improved health results from higher standards of living While the love of money may be the root of all evil, yet money itself is necessary for securing modern standards of health, happiness and morality President Hoover recognized that fact when he prescribed industrial construction as a preventive of civic ills, which would also result in illhealth of both the physical body and the civic community A goodly amount of hard work is necessary for the health of both individual and the state Ding prescribes it by the spoonful in the oldfashioned way, but everybody can understand his prescription and can take it if he will

A prescription from the N Y Herald Tribune, Nov 26, 1929

THE FAD OF WEIGHING

Dieting to reduce has its reflection in the ubiquitous scales, although in New York City fat people approach the scales furtively and in secret but out West they seem to be more bold Here is what the *New York Times* of November 22 says editorially about the fad of weighing

"Some doctors say that our health would be better if we did not watch it so closely, but whether that is true or not, we do watch it, and the penny scale is one device for checking

"Scale distributors have been going over their accounts and find that weighing is on the increase As more pounds are taken off, more people mount the trembling platform and anxiously watch the indicator swing around

"In Oklahoma City there are only ninety penny scales The citizens pay $27,000 a year to see if they have gained or lost That is a lot of pennies, but the average is only $25 a month per scale That sum is not a bad return on a very moderate investment

"Los Angeles, with less than ten times as many people, has almost 100 times as many scales It is only to be expected that they would pay well, as the eighteen-day diet and the movie ambitions of half the population make weighing a necessity Besides, the California weather is a help to the business, as overcoats, which discourage prospective weighers, do not have to be shed to get an accurate answer to the penny"

LEARNING BY EXPERIENCE

The following sensible editorial in the *New York Times* of November 22 will be approved by pediatricians as well as family doctors

"The dangers of a too methodical upbringing for children were pointed out at a recent meeting of the National Council for Mental Hygiene in London Dr Helen Boyd declared that a never varying regime of clocklike regularity is not the ideal one for modern children She considers that it does a healthy child no harm to have a large and sticky feast of cream buns once in a while and make himself sick In fact, such a juvenile orgy has its benefits From it the youngster learns the meaning of satiety, and gains a knowledge of the workings of his own body far more practical than anything which could be taught him from a book

'The child who always has his spinach and carrots at the right moment, who goes to bed in a quiet, darkened room at the same time every night, and takes the correct exercises at the correct time, is apt to become too dependent on routine He may grow into the sort of man who is miserable if dinner is five minutes late, and who suffers from insomnia if he is disturbed by the rattle of a window a crying baby or a barking dog

"It is certain that children at least will be delighted with Dr Boyd's suggestion Mothers who have followed the baby's schedule with religious fidelity should welcome justification for an occasional lapse If the theory could only be carried a little further and all children be gradually trained to sleep through violent radio concerts the city's anti-noise campaign could quietly end with the coming of age of a noise-proof generation '

PROTECTION FROM DOGS

The *New York Herald-Tribune* of November 18 prints the following suggestion regarding the management of dogs on the street and in public places

"Changes in the Sanitary Code to give the dog 'a fairer chance' are contained in a pamphlet entitled A Bill of Rights for the City Dog,' to be distributed today by the American Society for the Prevention of Cruelty to Animals

"The organization wants jurisdiction over dogs transferred from the Health Department to the police and magistrates in event somebody is bitten by a dog It is proposed the owner give bond for the animal's segregation and that only a magistrate should have 'power of life and death over a good dog'

"The society asks that an ordinance require that when outside the owner's premises a dog be 'securely held by a legally responsible person on a leash not over four feet long' The muzzle is characterized as an ineffective and useless hardship The society estimates there are 300,000 dogs in this city "

The suggestion is based on the erroneous supposition that City Magistrates can judge the health and infectivity of dogs better than the doctors of the Board of Health can judge them The *New York Times* of November 18 discusses the subject editorially and minimizes the danger from rabid dogs, saying

"Last year 6,000 persons were reported bitten by dogs, but not one of them contracted rabies In the thirty-five years that the society's employes have been handling stray dogs not a single case of rabies has developed, though the men have been bitten many times Rabies is rare, and a dog infected with it is less likely to bite than a healthy dog It is not pleasant to be bitten by a dog, but the wound is seldom dangerous, and a muzzle is not the best means of preventing dog bites If dogs are taken out, unmuzzled but on leash, and if the public will shake off the superstitious fear of rabies, dogs and people will both be better off "

The editor is talking about dogs of well-to-do persons, which constitute only a minority of the dogs of the city The health menace is that of the stray dog without a responsible owner

The *Times* also argues that when dogs are segregated by the Health Department, they catch distemper, and then continues the paper "If it survives it suffers after-effects similar to those of infantile paralysis among human beings While it is sick it is a source of infection not only to other dogs but to people The society points out that this law, 'designed to protect us against one extremely rare disease, has become an agency to promote the spread of another and extremely common one' If the owner were permitted to give bond for his dog's segregation and appearance in court, this danger would be eliminated "

The editorial is half right and half wrong The Department of Health can be trusted to handle the dog problem scientifically and intelligently, and efficiently

OUR NEIGHBORS

COUNTY HEALTH UNITS IN MICHIGAN

County Health Units were discussed on September 17, 1929, in the House of Delegates of the Michigan State Medical Society Dr Guy L Kiefer, State Commissioner of Health, defended their establishment in a clear address and then answered a running fire of questions put by critics of the plan Dr Kiefer said

"There was never a law allowing the establishment of county health units until 1928 It was then that the first law was passed, providing the Board of Supervisors of the County cared to allow them and allow the appropriation It is entirely within the hands of the appropriation body of the county whether any money should be allowed for that purpose or not

"The State Department of Health is very strongly in favor of the establishment of such County Health Units for the reason that it is the only method by which proper public health work can be done in this state It cannot be done from one central office It is impossible to do it that way In the southern part of the state they are pretty well organized for County Health Units They conduct their work more efficiently than any one central office could

"The State Department of Health asked for an appropriation of $60,000 for the purpose of giving state aid to the counties that chose to establish such County Health Units It was cut down to $30,000

"We have not asked any supervisor or any counties to establish any County Health Units, nor have we laid the possible value of it before them without first going to the County Medical Society laying before them our plan and asking them to endorse it, or not endorse it as they saw fit We have never asked for a County Health Unit from the supervisor unless we first had the endorsement of the doctors (See this JOURNAL, p 1520)

"We have further found out as nearly as possible, when we got ready to go before the supervisor, how much money was being expended for unorganized health work in that county We found almost invariably that they spend from $5,000 to $6,000 for a nurse to run around wild and not be supervised on some health work

"Our minimum estimate for a County Health Unit is $12,000 A county that is considering spending $12,000 has been spending $5,000 anyway The state will furnish $3,000, the Rockefeller Foundation will furnish $2,500, so they are not going to spend any more money in the start of this thing than they did before they had it

"The principal advantage of a County Health Unit, if I may say so at this time, is its organization We talk about health work that is to be done, health work that has been done, but you cannot do it unless it is properly organized and organized by an M D in charge of the work That is the strongest thing in favor of it

"These doctors who take charge of the County Health Units are appointed by the Board of Supervisors Never yet has one been appointed without our having been asked for a recommendation as to his qualifications In each case we have been able to recommend a man who has had some training, through the Rockefeller Foundation, in county health work

"We have a training school connected with our department in Lansing now and most of that is paid by the Rockefeller That is for men who want to take up this work

"We believe that a County Health Unit will do what it is my earnest wish can be done and will be done, it will turn the practice of medicine—and I am not talking about preventive medicine—over to the doctors The County Health Unit will succeed in, I am sure, informing the public that what they want to do is to go to the doctors to have their children and themselves examined and have everything done that has, up to this time, been done by the Department of Health and which shouldn't be done by them

"We advocate no clinical work by the County Health Units We have said in the past, and I think it will bear repeating, that when clinics are given at this time in public health work they are done for demonstrative purposes That should be just exactly what they are done for As soon as it has been demonstrated and the people find it out and know what needs to be done they should go to the doctor and have him do it for them

"What we need from the doctors to make this a success is their cooperation If they will just sit by and say that these fellows are going to take their business away from them they are not going to do any good and 'it is going to cost us a lot of money by taxation' then it is going to fail But if they will take hold and do the work that these County Health Units will teach the people should be done then it will be a success

"The result will be a much larger and more satisfactory practice of medicine for everybody that is in the game than there is now

"There are at present four County Health Units in the state and only one of them has kicked over the traces and does some of the things that you

AN EXPLANATION

The index is an arbitrary part of the JOURNAL which does not lend itself to expansion or contraction There are just so many subjects to be listed, and they sometimes refuse to conform to the pages that are available for making a beautifully balanced JOURNAL. This present index should either have at least seventy-five references added to the preceding page, or else one hundred references should be omitted, so that the index would end on page 1544

A third possibility would be to fill this page with reading matter, but in that case those who bind the index in the beginning of the volume would disarrange the reading pages

The conclusion of the editors is to leave this page empty, except for this informal explanation

First

AND ALL BASED UPON THE MEAD POLICY

First to biologically test every batch of cod liver oil.

First in America to make pure ergosterol commercially.

First to refer inquiries from mothers to their family physicians.

First to recognize that the nutrition of infants should be entirely in the hands of the physician.

First to offer physicians helpful services such as formula blanks, weight charts, appointment cards, etc.

First to recognize that activated ergosterol (Acterol) may be measured in potency only by biological test and not by grams of ergosterol activated.

MEAD'S POLICY—MEAD'S INFANT DIET
ADVERTISED ONLY TO PHYSICIANS

of Dextri-Maltose, Acterol and Other Mead Products Reflects Your Active Approval of This Policy. Is It Wo

men do not like and which I do not like They keep promising to reform They were established without a law before there was even a law in existence They have a lot of money to spend and they will have to begin getting results I am opposed to that I do not see how any County Health unit under the law—and they report to us every month what they are doing—could go far out of the way I do not think the law allows it

"A minimum County Health Unit as we recommend it consists of a Health Officer, who must be a Doctor of Medicine, at least one and preferably two nurses and a clerk If the thing is worthwhile and it works out well it is up to the County if they want to increase that number"

At the end of Dr Kiefer's talk a motion was made that a special committee be appointed to investigate the subject of "County Health Units", and that the counties be requested not to take further action until the State Society had decided the matter This motion was lost by a vote of 12 to 23

HEALTH EXAMINATIONS AT NEBRASKA STATE FAIR

The November issue of this Journal, page 1431, contained a brief reference to medical examinations offered to visitors at the Nebraska State Fair by the State Medical Society The November issue of the *Nebraska State Medical Journal* reports the results of the examinations as follows

"The profession will be interested to know that there were 231 adults and 74 children examined by members of our association at the Nebraska State Fair Of the 231 adults, 200 had abnormal and pathological conditions needing medical attention To this number the following form letter was sent

"'The Health Examination which you were given at the Nebraska State Fair revealed certain abnormal conditions which interfere with the normal functions of your body and materially affect your health

"These conditions are remediable if given immediate attention, so if you will send me the name and address of your family physician, your examination record will be forwarded to him and he will give you advice regarding treatment

Yours very truly,
Nebraska State Medical Association
Public Activities Committee
E R Hays, Chairman

early stages in a youngster two years old, five cases of fibroid tumor, two ulcers of the stomach, two of Bright's disease, one of diabetes, eighteen of high blood pressure and one cancer One child, thought by its parents to be suffering from asthma and hay fever, proved in his examination to have an enlarged heart Three cases of contagious skin disease in children were found

"In many persons, minor ailments, pointing to a breakdown within a few years, were determined by the examinations

"Within three weeks one-fourth of the number requested that the record be sent to their family physician

"In all, the demonstration was a huge success and shows that people will take an interest in health examinations if the matter is presented in the proper manner"

INDEMNITY INSURANCE IN VIRGINIA AND WEST VIRGINIA

The report of the Medical Economics Committee of the Medical Society of Virginia, to the House of Delegates on October 22, 1929, printed in the November JOURNAL states that defense against malpractice suits by the Virginia State Society was discontinued on December 31, 1928, but the Society had arranged that the members take out indemnity insurance on a uniform plan The report says

"Being guided by the suggestions and wishes of the Society, this committee made plans to endeavor to get every member of the Society to take out Medical Defense Insurance We first obtained the best rates for a standard policy, which are as follows

(1) The present rate of $15 00 for the usual $5,000 00-$15,000 00 indemnity protection is continued for individual policies

(2) For county and city societies, group policies providing above indemnity are offered for $13 50 a year, provided group is not less than 15 and that it must have at least 50 per cent of the county membership

(3) As soon as the number of physicians insured by this company, including individual policy holders and those now in groups, is 1,001, the rate for all will be reduced to $12 50 annually

"We then wrote a letter to the members of the Medical Society of Virginia, in which we informed them that the Society had decided to discontinue legal defense after December 31, 1928 We also tried to impress upon the members the necessity for carrying indemnity insurance The response was not as great as we had hoped for The Secretary also en-

(*Continued on page 1551—adv xiv*)

(Continued from page 1550—adv xv)

closed cards in her correspondence with members during the year in which she endeavored to impress upon them the advantages of carrying a policy

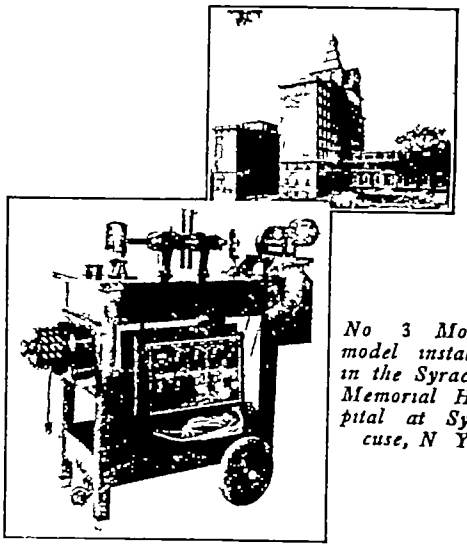
'Following the presentation of this report, Mr G H Winfrey, a representative of the Ætna Casualty and Insurance Company, was given a few minutes in which to tell of a plan for the indemnity insurance which had been offered by the Ætna Company and which had been endorsed by the Medical Economics Committee. He stated that as soon as 1,001 of our members are insured with his company, the rate for the $5,000-$15,000 protection will automatically drop from $15 00 to $12 50 per member a year Approximately seven hundred of our members are now insured with this company He said that twelve suits were brought against members of our Society during the past year for alleged civil malpractice, which fact indicates the urgency for this protection The medical societies of North Carolina and West Virginia have already insured a sufficient number to secure the special rate offered by the Ætna

"After the explanation of the group plan of insurance by the Ætna Company, Dr J Allison Hodges moved the adoption of the plan suggested by Mr Winfrey and Dr Boyd's report Seconded and carried"

The November West Virginia Medical Journal says that State also has abolished malpractice defense by the State Society and in its place recommended that the Group Indemnity plan of the Ætna Insurance Company be adopted by the physicians of the State of whom 521 are already insured with that company

POST GRADUATE COURSES IN VIRGINIA

The House of Delegates of the Medical Society of Virginia, assembled on October 22, received the reports of postgraduate education which agreed in their main features These reports outlined an elaborate plan for bringing instruction to the doctors in their own counties The Committee on Medical Education and Hospitals reported



"The essential basic features, incorporated more fully in the recommendations herewith submitted are

1 That the State Society shall be the sponsor and connecting link between the different units,

2 That the component Societies, including

"Hindle" Electrocardiographs

No 3 Mobile model installed in the Syracuse Memorial Hospital at Syracuse, N Y

in Prominent Hospitals

Since the installation, 15 years ago, of the pioneer "Hindle" Electrocardiograph in the Rockefeller Institute, New York City, many leading hospitals and institutions have selected the "Hindle" Electrocardiograph as standard equipment

The No 3 model Mobile type, as installed in the newly completed Syracuse Memorial Hospital at Syracuse, N Y, can be wheeled to the patient's bedside

In order to meet the varied requirements of Diagnosis, Research & Teaching, the Hindle Electrocardiograph is made in 4 models

Model No 1 For institutional research work.

Model No 2 For the large hospital.

Model No 3 Stationary type. For the clinic, hospital or office.
Mobile type. Can be wheeled from room to room

Portable Model. Can be carried to patient's home.

district and group units, shall be the vitaliz factors,

3 That the Councilor in each Counci District shall be advisor, and one of the lo directors,

4 That the regional hospitals in each d trict shall be requested by the local compone Societies to aid in the work,

5 That the Doctors' Educational and Cli cal Bureau, when established, shall act as supply and Exchange station, as well as professional clearing house for correlation courses and co-ordination generally of t extension work

"It shall be the duty of the Bureau, in co junction with the Advisory Board, to form late such rules and regulations as may see necessary to put into effect the desire of t State Society to inaugurate a plan for t continuous medical education of its membe in their respective councilor districts at per odical meetings, at which Diagnostic Clinic Clinical Lectures, Current Medical Review etc, may be given, and also to provide for a Clinics for the annuaul sessions of the Stat Society"

The report also discusses the cooperation o the medical colleges, the local hospitals, th State Department of Health and the Stat Journal in carrying on the courses

A special committee on Post Graduate work covered largely the same ground with the same suggestions, and ended with the following sug gestions —

"By way of summary, and in conclusion your committee would state that in its opinion the most promising means of developing interest in postgraduate work would seem to be by experimenting with didactic lectures and clinics, particularly upon the first day's meeting of the State Society as a model, and in such councilor districts as may become interested, with the plan and purpose that the reading of journals and literature may be further stimulated, and particularly, that the attendance upon the courses given by our two medical schools may be generally popularized, and the schools encouraged to make these courses an important feature of their curricula and to the further end that some systematic plan of home study and instruction be gradually evolved"

The House voted to request the two committees to work out a practical plan and report at the 1930 meeting

MEDICAL SERVICE TO GROUPS IN CALIFORNIA

The November issue of California and Western Medicine contains an editorial on a plan to combat State Medicine which says

"There is hardly a commonwealth in the union which does not show here and there expressions of paternalism in relation to preventive medicine, which can be construed to be nothing else than the beginning signs of state medicine

"In California only a few weeks ago, a strenuous fight was made to have the Golden State lead the way for the United States in the institution of state medicine The hard-fought battle of that day in which the medical profession was victorious, was won in good part through the active work of an organization which came into existence at that time—the California League for the Conservation of Public Health — and which still carries on through the Better Health Foundation of California

"The attention of every member of the California Medical Association is called to the action taken at the last annual session in May, 1929, at San Diego, when the House of Delegates adopted a resolution, instructing and giving the Council power to act in the investigation and promotion of measures which would bring about a betterment of the conditions having to do with sickness and injury, and in which the professional and economic interests of the laity and members of the medical profession were involved

"It is very gratifying to know that one plan roughly mapped out by Dr Walter Coffey of San Francisco, presents some constructive innovations quite different from any thus far brought forward, and has features which appeal very much to many members of the Council of the California Medical Association

"The plan proposed by Doctor Coffey would permit the care of industrial employees and their families to continue as at present, without serious interference with the medical practice methods now in vogue The patient would choose his own physician from among those members of the California Medical Association who had stated they were willing to give medical and surgical services to the group of citizens coming under a certain industrial and income classification which would be outlined The statements for services would be sent not to the patients but to a central organization or office which, as trustee, would collect the bills, and make repayment to the attending physicians The money which would pay for services which were rendered would be collected through a monthly deduction on the wages of the employees, and would be turned over to the Association by the employers [illegible] under consideration the

POPULAR MEDICAL EDUCATION IN ILLINOIS

The November issue of the *Illinois Medical Journal,* discussing popular medical talks, says

Many public speakers and writers are advocating that the medical profession educate the people to seek medical advice to prevent disease rather than to cure it This is not a new thought The Illinois State Medical Society at its meeting in June, 1922, passed a resolution to the effect that "The House of Delegates goes on record as endorsing a broad plan of education through pamphlets, addresses and the lay press, any or all, to the end that the public be enlightened on the truths and principles contained in the development, progress and present status of medicine"

So the machinery for bringing this desired program into effect was set up, but it was not until 1925 that real activities in health education were begun The work of the Educational Committee, appointed by the Council, has resulted in a better understanding between certain lay groups and the profession The public wants to be educated and is using the various means of securing "health" information offered by the Education Committee

Read what the public thinks about the talks that are being given practically every day of the year by representatives of the Committee

"It is certainly gratifying to a layman to know what the Medical Profession is trying, with all its might, to accomplish for the human race"—President of a club of young business men

"We were very well satisfied with the talks and we certainly thank the Illinois State Medical Society for cooperating with the Home Bureau I am sure the Home Bureau Women have appreciated this opportunity of hearing these doctors"—County Adviser of Home Bureaus

Fifty health educational talks given during the month of members of the Speakers the Educational

STANDARDS OF THE PRACTICE OF SURGERY IN NEW JERSEY

The adoption of standards for the recognition of surgeons is being considered in New Jersey as well as New York State The November issue of the Journal of New Jersey says editorially

"If any physician or surgeon doubts the need for serious consideration of this topic, we suggest that he shall listen to and try to answer (as we have been compelled to do) the complaints filed against the profession by legislators and other intelligent laymen, tales of alleged malpractice that cause reputable members of the profession to blush with shame that such charges can be made against anyone entitled to practice the healing art The public will not be asking anything unreasonable if it demands that surgeons, general and special, shall present evidence of fitness before being allowed to practice in their respective fields We ought not to wait for such a request, certainly should not wait until the request is made in the form of a legal requirement We are proud of having raised the standards of medical education without compulsory action Would it not be well to correct the evils that every medical man knows exist in association with surgical work?

"We discussed this question in our annual report to the House of Delegates (Supplement to September Journal, page 8) and asked that a special committee be appointed to study the situation and propose a remedy The House referred the matter to the Welfare Committee, and at the first meeting of that body held October 27, a subcommittee was appointed to take this problem under advisement That the matter is not purely local was shown by the fact that Dr Harry R Trick, of Buffalo, in his Presidential Address to the Medical Society of New York, discussed it in his annual address"

TREATMENT OF GENERAL PERITONITIS

By R. FRANKLIN CARTER, M D, NEW YORK, N Y

From the Department of Surgery, Post Graduate Hospital

THE treatment of a patient with general peritonitis is a challenge to the best in every institution All the functions of the hospital are brought into play, and nothing but the best will succeed The reward is complete recovery The situation is always dramatic and of great interest, as no two patients require the same in the exercise of judgment At the head of this action stands the surgeon upon whom the responsibility for the outcome depends There is no other situation in the practise of medicine in which judgment of what to do and when to do it plays so great a role That great teacher, experience, is still a necessity in the development of good judgment However, there are means of assistance in every complete hospital upon which dependence may be placed in arriving at a conclusion

The etiology of general peritonitis does not materially change the nature of the case except in the type of organisms present, and the individual resisting powers of the patient to the particular strain of bacteria The streptococcus and pneumococcus produce the type of general peritonitis most difficult to cope with The non hemolysing strains of the former organism singly or in company with the colon bacillus produces the type best suited for general consideration

The factors for consideration in dealing with this subject are The surgery that is to be employed to deal with the source of the infection, the prevention or the relief of ileus, and maintenance of an adequate state of nutrition In addition to the above factors in the case of pneumococcus peritonitis there is the additional feature of specific theraphy with antibody solutions This, however, is still in the experimental stage

Whenever the question of surgery in peritonitis comes up drainage soon appears, and there the discussion finally ends in dispute No problem in surgery has received more attention than this one of drainage A survey of the literature soon convinces one that the principle is fundamentally wrong either in its inception or execution The most carefully carried out experiments which show the futility in trying to drain the general peritoneal cavity for any length of time by men whose veracity and ability are not to be questioned have failed to quiet the controversy over this question The old adage, "when in doubt drain," is still quoted and no doubt practised But it appears to one that there are five rational reasons for drainage The presence in the abdominal cavity of urine, bile, and intestinal content, a gangrenous area which cannot be removed and which will later liquefy and slough away, such as an abscess wall, and in instances where hemorrhage may occur in the presence of a slow ooze from a raw surface to prevent hematoma, and when there is active bleeding either from slough or an area which cannot be securely controlled by ligature The drainage material employed has been as varied as it is possible for it to be Every type of plug and pipe has been used to prevent and encourage the flow of peritoneal exudate. Soft substances such as gauze enclosed within either rubber tissue or a soft rubber sheath are less harmful and establish a tract down to the site of the abscess as well as solid tubes except in deep cavities such as the subhepatic space or pelvic cavity In such places the channel may be left tortuous by the bending of the softer tubes by the edge of the liver or coils of intestine, and a straight sinus may be formed by the introduction of a stiff rubber tube wrapped with gauze Tubes in themselves drain for only a short time before becoming plugged with fibrin and more drainage material will escape around the drain than thru it regardless of the nature of the drain Removal of drains should not be done before the sixth to eighth day at which time the walls of the tract have been securely formed with fibrinous exudate, the wall of the abscess cavity will have begun to liquefy, and the gauze covered tube will escape from the tract without causing pain as the fibrin filled meshes are freed by liquefaction

Thoracodotomy advised and practised for a time seemed to offer a good deal in the way of eliminating toxins and pathogenic bacteria But when subjected to experiment upon animals it did not prove to be a procedure of value

Repair of the injured viscus or the removal of a gangrenous mass should be done when the patient will stand it. And as there is no yardstick with which to measure the stamina of an individual, the time and type of surgery is a matter of judgment. The patient may be lost or saved by immediate operation, the same is true for delay

The prevention and relief of distension in peritonitis is another cause for a variety of opinion and heated debate, therefore interesting The methods employed for emptying the stomach and intestine have seemed to spring from the hand rather than the head, in that the causes or what would seem to be, have received little consideration Distension is not due to the lack of evacuation of the rectum for three or four or even ten days For without irritation either within or without the gut and starvation of the musculature of the wall of the gut an individual does not distend when the bowels do not move. Ileus of this type has been termed properly, paralytic. The usual tone is disturbed, and the intestine dilates with the resulting distension of the abdomen With the exception of marked dilatation of the stomach, this distension is in general of more concern and distress to the surgeon than to the

The factors for consideration in dealing with this subject are The surgery that is to be employed to deal with the source of the infection, the prevention or the relief of ileus, and maintenance of an adequate state of nutrition In addition to the above factors in the case of pneumococcus peritonitis there is the additional feature of specific theraphy with antibody solutions This, however, is still in the experimental stage

Whenever the question of surgery in peritonitis comes up drainage soon appears, and there the discussion finally ends in dispute No problem in surgery has received more attention than this one of drainage A survey of the literature soon convinces one that the principle is fundamentally wrong either in its inception or execution The most carefully carried out experiments which show the futility in trying to drain the general peritoneal cavity for any length of time by men whose veracity and ability are not to be questioned have failed to quiet the controversy over this question The old adage, "when in doubt drain," is still quoted and no doubt practised But it appears to one that there are five rational reasons for drainage The presence in the abdominal cavity of urine, bile, and intestinal content, a gangrenous area which cannot be removed and which will later liquefy and slough away, such as an abscess wall, and in instances where hemorrhage may occur in the presence of a slow ooze from a raw surface to prevent hematoma, and when there is active bleeding either from slough or an area which cannot be securely controlled by ligature The drainage material employed has been as varied as it is possible for it to be Every type of plug and pipe has been used to prevent and encourage the flow of peritoneal exudate. Soft substances such as gauze enclosed within either rubber tissue or a soft rubber sheath are less harmful and establish a tract down to the site of the abscess as well as solid tubes except in deep cavities such as the subhepatic space or pelvic cavity In such places the channel may be left tortuous by the bending of the softer tubes by the edge of the liver or coils of intestine, and a straight sinus may be formed by the introduction of a stiff rubber tube wrapped with gauze Tubes in themselves drain for only a short time before becoming plugged with fibrin and more drainage material will escape around the drain than thru it regardless of the nature of the drain Removal of drains should not be done before the sixth to eighth day at which time the walls of the tract have been securely formed with fibrinous exudate, the wall of the abscess cavity will have begun to liquefy, and the gauze covered tube will escape from the tract without causing pain as the fibrin filled meshes are freed by liquefaction

Thoracodotomy advised and practised for a time seemed to offer a good deal in the way of eliminating toxins and pathogenic bacteria But when subjected to experiment upon animals it did not prove to be a procedure of value

Repair of the injured viscus or the removal of a gangrenous mass should be done when the patient will stand it. And as there is no yardstick with which to measure the stamina of an individual, the time and type of surgery is a matter of judgment. The patient may be lost or saved by immediate operation, the same is true for delay

The prevention and relief of distension in peritonitis is another cause for a variety of opinion and heated debate, therefore interesting The methods employed for emptying the stomach and intestine have seemed to spring from the hand rather than the head, in that the causes or what would seem to be, have received little consideration Distension is not due to the lack of evacuation of the rectum for three or four or even ten days For without irritation either within or without the gut and starvation of the musculature of the wall of the gut an individual does not distend when the bowels do not move. Ileus of this type has been termed properly, paralytic. The usual tone is disturbed, and the intestine dilates with the resulting distension of the abdomen With the exception of marked dilatation of the stomach, this distension is in general of more concern and distress to the surgeon than to the
